## Exercise 11.1

## Question 1:

If a line makes angles $90^{\circ}, 135^{\circ}, 45^{\circ}$ with $x, y$ and $z$-axes respectively, find its direction cosines.

## Answer

Let direction cosines of the line be $I, m$, and $n$.
$l=\cos 90^{\circ}=0$
$m=\cos 135^{\circ}=-\frac{1}{\sqrt{2}}$
$n=\cos 45^{\circ}=\frac{1}{\sqrt{2}}$

Therefore, the direction cosines of the line are $0,-\frac{1}{\sqrt{2}}$, and $\frac{1}{\sqrt{2}}$.

## Question 2:

Find the direction cosines of a line which makes equal angles with the coordinate axes.
Answer
Let the direction cosines of the line make an angle $a$ with each of the coordinate axes.
$\therefore I=\cos a, m=\cos a, n=\cos a$
$l^{2}+m^{2}+n^{2}=1$
$\Rightarrow \cos ^{2} \alpha+\cos ^{2} \alpha+\cos ^{2} \alpha=1$
$\Rightarrow 3 \cos ^{2} \alpha=1$
$\Rightarrow \cos ^{2} \alpha=\frac{1}{3}$
$\Rightarrow \cos \alpha= \pm \frac{1}{\sqrt{3}}$

Thus, the direction cosines of the line, which is equally inclined to the coordinate axes,
are $\pm \frac{1}{\sqrt{3}}, \pm \frac{1}{\sqrt{3}}$, and $\pm \frac{1}{\sqrt{3}}$.

## Question 3:

If a line has the direction ratios $-18,12,-4$, then what are its direction cosines?
Answer
If a line has direction ratios of $-18,12$, and -4 , then its direction cosines are
$\frac{-18}{\sqrt{(-18)^{2}+(12)^{2}+(-4)^{2}}}, \frac{12}{\sqrt{(-18)^{2}+(12)^{2}+(-4)^{2}}}, \frac{-4}{\sqrt{(-18)^{2}+(12)^{2}+(-4)^{2}}}$
i.e., $\frac{-18}{22}, \frac{12}{22}, \frac{-4}{22}$
$\frac{-9}{11}, \frac{6}{11}, \frac{-2}{11}$

Thus, the direction cosines are $-\frac{9}{11}, \frac{6}{11}$, and $\frac{-2}{11}$.

## Question 4:

Show that the points $(2,3,4),(-1,-2,1),(5,8,7)$ are collinear.
Answer
The given points are $A(2,3,4), B(-1,-2,1)$, and $C(5,8,7)$.
It is known that the direction ratios of line joining the points, $\left(x_{1}, y_{1}, z_{1}\right)$ and $\left(x_{2}, y_{2}, z_{2}\right)$, are given by, $x_{2}-x_{1}, y_{2}-y_{1}$, and $z_{2}-z_{1}$.
The direction ratios of $A B$ are $(-1-2),(-2-3)$, and (1-4) i.e., $-3,-5$, and -3 . The direction ratios of $B C$ are $(5-(-1)),(8-(-2))$, and $(7-1)$ i.e., 6,10 , and 6. It can be seen that the direction ratios of $B C$ are -2 times that of $A B$ i.e., they are proportional.
Therefore, $A B$ is parallel to $B C$. Since point $B$ is common to both $A B$ and $B C$, points $A, B$, and $C$ are collinear.

## Question 5:

Find the direction cosines of the sides of the triangle whose vertices are $(3,5,-4),(-$ $1,1,2)$ and (-5, -5, - 2)

## Answer

The vertices of $\triangle A B C$ are $A(3,5,-4), B(-1,1,2)$, and $C(-5,-5,-2)$.

The direction ratios of side $A B$ are $(-1-3),(1-5)$, and $(2-(-4))$ i.e., $-4,-4$, and 6 .

$$
\text { Then, } \begin{aligned}
\sqrt{(-4)^{2}+(-4)^{2}+(6)^{2}} & =\sqrt{16+16+36} \\
& =\sqrt{68} \\
& =2 \sqrt{17}
\end{aligned}
$$

Therefore, the direction cosines of $A B$ are

$$
\begin{aligned}
& \frac{-4}{\sqrt{(-4)^{2}+(-4)^{2}+(6)^{2}}}, \frac{-4}{\sqrt{(-4)^{2}+(-4)^{2}+(6)^{2}}}, \frac{6}{\sqrt{(-4)^{2}+(-4)^{2}+(6)^{2}}} \\
& \frac{-4}{2 \sqrt{17}},-\frac{4}{2 \sqrt{17}}, \frac{6}{2 \sqrt{17}} \\
& \frac{-2}{\sqrt{17}}, \frac{-2}{\sqrt{17}}, \frac{3}{\sqrt{17}}
\end{aligned}
$$

The direction ratios of $B C$ are $(-5-(-1)),(-5-1)$, and $(-2-2)$ i.e., $-4,-6$, and -4 . Therefore, the direction cosines of $B C$ are

$$
\begin{aligned}
& \frac{-4}{\sqrt{(-4)^{2}+(-6)^{2}+(-4)^{2}}}, \frac{-6}{\sqrt{(-4)^{2}+(-6)^{2}+(-4)^{2}}}, \frac{-4}{\sqrt{(-4)^{2}+(-6)^{2}+(-4)^{2}}} \\
& \text { i.e., } \frac{-4}{2 \sqrt{17}}, \frac{-6}{2 \sqrt{17}}, \frac{-4}{2 \sqrt{17}}
\end{aligned}
$$

The direction ratios of CA are $(-5-3),(-5-5)$, and $(-2-(-4))$ i.e., $-8,-10$, and 2 . Therefore, the direction cosines of $A C$ are

$$
\begin{aligned}
& \frac{-8}{\sqrt{(-8)^{2}+(10)^{2}+(2)^{2}}}, \frac{-5}{\sqrt{(-8)^{2}+(10)^{2}+(2)^{2}}}, \frac{2}{\sqrt{(-8)^{2}+(10)^{2}+(2)^{2}}} \\
& \text { i.e., } \frac{-8}{2 \sqrt{42}}, \frac{-10}{2 \sqrt{42}}, \frac{2}{2 \sqrt{42}}
\end{aligned}
$$

## Exercise 11.2

## Question 1:

Show that the three lines with direction cosines

$$
\frac{12}{13}, \frac{-3}{13}, \frac{-4}{13} ; \frac{4}{13}, \frac{12}{13}, \frac{3}{13} ; \frac{3}{13}, \frac{-4}{13}, \frac{12}{13} \text { are mutually perpendicular. }
$$

## Answer

Two lines with direction cosines, $I_{1}, m_{1}, n_{1}$ and $I_{2}, m_{2}, n_{2}$, are perpendicular to each other, if $I_{1} l_{2}+m_{1} m_{2}+n_{1} n_{2}=0$
(i) For the lines with direction cosines, $\frac{12}{13}, \frac{-3}{13}, \frac{-4}{13}$ and $\frac{4}{13}, \frac{12}{13}, \frac{3}{13}$, we obtain

$$
\begin{aligned}
l_{1} l_{2}+m_{1} m_{2}+n_{1} n_{2} & =\frac{12}{13} \times \frac{4}{13}+\left(\frac{-3}{13}\right) \times \frac{12}{13}+\left(\frac{-4}{13}\right) \times \frac{3}{13} \\
& =\frac{48}{169}-\frac{36}{169}-\frac{12}{169} \\
& =0
\end{aligned}
$$

Therefore, the lines are perpendicular.
(ii) For the lines with direction cosines, $\frac{4}{13}, \frac{12}{13}, \frac{3}{13}$ and $\frac{3}{13}, \frac{-4}{13}, \frac{12}{13}$, we obtain

$$
\begin{aligned}
l_{1} l_{2}+m_{1} m_{2}+n_{1} n_{2} & =\frac{4}{13} \times \frac{3}{13}+\frac{12}{13} \times\left(\frac{-4}{13}\right)+\frac{3}{13} \times \frac{12}{13} \\
& =\frac{12}{169}-\frac{48}{169}+\frac{36}{169} \\
& =0
\end{aligned}
$$

Therefore, the lines are perpendicular.
(iii) For the lines with direction cosines, $\frac{3}{13}, \frac{-4}{13}, \frac{12}{13}$ and $\frac{12}{13}, \frac{-3}{13}, \frac{-4}{13}$, we obtain

$$
\begin{aligned}
l_{1} l_{2}+m_{1} m_{2}+n_{1} n_{2} & =\left(\frac{3}{13}\right) \times\left(\frac{12}{13}\right)+\left(\frac{-4}{13}\right) \times\left(\frac{-3}{13}\right)+\left(\frac{12}{13}\right) \times\left(\frac{-4}{13}\right) \\
& =\frac{36}{169}+\frac{12}{169}-\frac{48}{169} \\
& =0
\end{aligned}
$$

Therefore, the lines are perpendicular.
Thus, all the lines are mutually perpendicular.

## Question 2:

Show that the line through the points $(1,-1,2)(3,4,-2)$ is perpendicular to the line through the points $(0,3,2)$ and $(3,5,6)$.
Answer
Let $A B$ be the line joining the points, $(1,-1,2)$ and $(3,4,-2)$, and $C D$ be the line joining the points, $(0,3,2)$ and ( $3,5,6$ ).
The direction ratios, $a_{1}, b_{1}, c_{1}$, of $A B$ are ( $3-1$ ), $(4-(-1))$, and ( $-2-2$ ) i.e., 2,5 , and -4 .

The direction ratios, $a_{2}, b_{2}, c_{2}$, of CD are (3-0), (5-3), and (6-2) i.e., 3,2 , and 4. AB and CD will be perpendicular to each other, if $a_{1} a_{2}+b_{1} b_{2}+c_{1} c_{2}=0$
$a_{1} a_{2}+b_{1} b_{2}+c_{1} c_{2}=2 \times 3+5 \times 2+(-4) \times 4$
$=6+10-16$
$=0$
Therefore, $A B$ and $C D$ are perpendicular to each other.

## Question 3:

Show that the line through the points $(4,7,8)(2,3,4)$ is parallel to the line through the points ( $-1,-2,1$ ), ( $1,2,5$ ).

## Answer

Let $A B$ be the line through the points, $(4,7,8)$ and $(2,3,4)$, and $C D$ be the line through the points, $(-1,-2,1)$ and $(1,2,5)$.

The directions ratios, $a_{1}, b_{1}, c_{1}$, of AB are $(2-4),(3-7)$, and $(4-8)$ i.e., $-2,-4$, and -4.

The direction ratios, $a_{2}, b_{2}, c_{2}$, of CD are (1-(-1)), (2-(-2)), and (5-1) i.e., 2, 4, and 4.

AB will be parallel to CD , if $\frac{a_{1}}{a_{2}}=\frac{b_{1}}{b_{2}}=\frac{c_{1}}{c_{2}}$
$\frac{a_{1}}{a_{2}}=\frac{-2}{2}=-1$
$\frac{b_{1}}{b_{2}}=\frac{-4}{4}=-1$
$\frac{c_{1}}{c_{2}}=\frac{-4}{4}=-1$
$\therefore \frac{a_{1}}{a_{2}}=\frac{b_{1}}{b_{2}}=\frac{c_{1}}{c_{2}}$
Thus, $A B$ is parallel to $C D$.

## Question 4:

Find the equation of the line which passes through the point $(1,2,3)$ and is parallel to the vector $3 \hat{i}+2 \hat{j}-2 \hat{k}$.
Answer
It is given that the line passes through the point $A(1,2,3)$. Therefore, the position vector through A is $\vec{a}=\hat{i}+2 \hat{j}+3 \hat{k}$
$\vec{b}=3 \hat{i}+2 \hat{j}-2 \hat{k}$
It is known that the line which passes through point A and parallel to $\vec{b}$ is given by
$\vec{r}=\vec{a}+\lambda \vec{b}$, where $\lambda$ is a constant.
$\Rightarrow \vec{r}=\hat{i}+2 \hat{j}+3 \hat{k}+\lambda(3 \hat{i}+2 \hat{j}-2 \hat{k})$
This is the required equation of the line.

## Question 5:

Find the equation of the line in vector and in Cartesian form that passes through the point with position vector $2 \hat{i}-\hat{j}+4 \hat{k}$ and is in the direction $\hat{i}+2 \hat{j}-\hat{k}$.
Answer
It is given that the line passes through the point with position vector
$\vec{a}=2 \hat{i}-\hat{j}+4 \hat{k}$
$\vec{b}=\hat{i}+2 \hat{j}-\hat{k}$

It is known that a line through a point with position vector $\vec{a}$ and parallel to $\vec{b}$ is given by the equation, $\vec{r}=\vec{a}+\lambda \vec{b}$
$\Rightarrow \vec{r}=2 \hat{i}-\hat{j}+4 \hat{k}+\lambda(\hat{i}+2 \hat{j}-\hat{k})$
This is the required equation of the line in vector form.
$\vec{r}=x \hat{i}-y \hat{j}+z \hat{k}$
$\Rightarrow x \hat{i}-y \hat{j}+z \hat{k}=(\lambda+2) \hat{i}+(2 \lambda-1) \hat{j}+(-\lambda+4) \hat{k}$
Eliminating $\lambda$, we obtain the Cartesian form equation as
$\frac{x-2}{1}=\frac{y+1}{2}=\frac{z-4}{-1}$
This is the required equation of the given line in Cartesian form.

## Question 6:

Find the Cartesian equation of the line which passes through the point
$(-2,4,-5)$ and parallel to the line given by $\frac{x+3}{3}=\frac{y-4}{5}=\frac{z+8}{6}$
Answer
It is given that the line passes through the point $(-2,4,-5)$ and is parallel to
$\frac{x+3}{3}=\frac{y-4}{5}=\frac{z+8}{6}$

The direction ratios of the line, $\frac{x+3}{3}=\frac{y-4}{5}=\frac{z+8}{6}$, are 3,5 , and 6.
The required line is parallel to $\frac{x+3}{3}=\frac{y-4}{5}=\frac{z+8}{6}$
Therefore, its direction ratios are $3 k, 5 k$, and $6 k$, where $k \neq 0$
It is known that the equation of the line through the point $\left(x_{1}, y_{1}, z_{1}\right)$ and with direction
ratios, $a, b, c$, is given by $\frac{x-x_{1}}{a}=\frac{y-y_{1}}{b}=\frac{z-z_{1}}{c}$

Therefore the equation of the required line is
$\frac{x+2}{3 k}=\frac{y-4}{5 k}=\frac{z+5}{6 k}$
$\Rightarrow \frac{x+2}{3}=\frac{y-4}{5}=\frac{z+5}{6}=k$

## Question 7:

The Cartesian equation of a line is $\frac{x-5}{3}=\frac{y+4}{7}=\frac{z-6}{2}$. Write its vector form.
Answer
The Cartesian equation of the line is
$\frac{x-5}{3}=\frac{y+4}{7}=\frac{z-6}{2}$
The given line passes through the point $(5,-4,6)$. The position vector of this point is
$\vec{a}=5 \hat{i}-4 \hat{j}+6 \hat{k}$
Also, the direction ratios of the given line are 3, 7, and 2 .
This means that the line is in the direction of vector, $\vec{b}=3 \hat{i}+7 \hat{j}+2 \hat{k}$
It is known that the line through position vector $\vec{a}$ and in the direction of the vector $\vec{b}$ is given by the equation, $\vec{r}=\vec{a}+\lambda \vec{b}, \lambda \in R$
$\Rightarrow \vec{r}=(5 \hat{i}-4 \hat{j}+6 \hat{k})+\lambda(3 \hat{i}+7 \hat{j}+2 \hat{k})$
This is the required equation of the given line in vector form.

## Question 8:

Find the vector and the Cartesian equations of the lines that pass through the origin and (5, -2, 3).

Answer
The required line passes through the origin. Therefore, its position vector is given by,
$\vec{a}=\overrightarrow{0}$
The direction ratios of the line through origin and $(5,-2,3)$ are
$(5-0)=5,(-2-0)=-2,(3-0)=3$

The line is parallel to vector given by the equation, $\vec{b}=5 \hat{i}-2 \hat{j}+3 \hat{k}$
The equation of the line in vector form through a point with position vector $\vec{a}$ and parallel
to $\vec{b}$ is, $\vec{r}=\vec{a}+\lambda \vec{b}, \lambda \in R$
$\Rightarrow \vec{r}=\overrightarrow{0}+\lambda(5 \hat{i}-2 \hat{j}+3 \hat{k})$
$\Rightarrow \vec{r}=\lambda(5 \hat{i}-2 \hat{j}+3 \hat{k})$
The equation of the line through the point $\left(x_{1}, y_{1}, z_{1}\right)$ and direction ratios $a, b, c$ is given
by, $\frac{x-x_{1}}{a}=\frac{y-y_{1}}{b}=\frac{z-z_{1}}{c}$
Therefore, the equation of the required line in the Cartesian form is
$\frac{x-0}{5}=\frac{y-0}{-2}=\frac{z-0}{3}$
$\Rightarrow \frac{x}{5}=\frac{y}{-2}=\frac{z}{3}$

## Question 9:

Find the vector and the Cartesian equations of the line that passes through the points (3, $-2,-5),(3,-2,6)$.

Answer
Let the line passing through the points, $P(3,-2,-5)$ and $Q(3,-2,6)$, be $P Q$.
Since $P Q$ passes through $P(3,-2,-5)$, its position vector is given by,
$\vec{a}=3 \hat{i}-2 \hat{j}-5 \hat{k}$
The direction ratios of $P Q$ are given by,
$(3-3)=0,(-2+2)=0,(6+5)=11$
The equation of the vector in the direction of $P Q$ is
$\vec{b}=0 . \hat{i}-0 . \hat{j}+11 \hat{k}=11 \hat{k}$

The equation of PQ in vector form is given by, $\vec{r}=\vec{a}+\lambda \vec{b}, \lambda \in R$
$\Rightarrow \vec{r}=(3 \hat{i}-2 \hat{j}-5 \hat{k})+11 \lambda \hat{k}$
The equation of $P Q$ in Cartesian form is
$\frac{x-x_{1}}{a}=\frac{y-y_{1}}{b}=\frac{z-z_{1}}{c}$ i.e., $\quad \frac{x-3}{0}=\frac{y+2}{0}=\frac{z+5}{11}$

## Question 10:

Find the angle between the following pairs of lines:
(i) $\vec{r}=2 \hat{i}-5 \hat{j}+\hat{k}+\lambda(3 \hat{i}-2 \hat{j}+6 \hat{k})$ and
$\vec{r}=7 \hat{i}-6 \hat{k}+\mu(\hat{i}+2 \hat{j}+2 \hat{k})$
(ii) $\vec{r}=3 \hat{i}+\hat{j}-2 \hat{k}+\lambda(\hat{i}-\hat{j}-2 \hat{k})$ and
$\vec{r}=2 \hat{i}-\hat{j}-56 \hat{k}+\mu(3 \hat{i}-5 \hat{j}-4 \hat{k})$
Answer
(i) Let Q be the angle between the given lines.

The angle between the given pairs of lines is given by, $\cos Q=\left|\frac{\vec{b}_{1} \cdot \vec{b}_{2}}{\left|\vec{b}_{1}\right|\left|\vec{b}_{2}\right|}\right|$

The given lines are parallel to the vectors, $\vec{b}_{1}=3 \hat{i}+2 \hat{j}+6 \hat{k}$ and $\vec{b}_{2}=\hat{i}+2 \hat{j}+2 \hat{k}$, respectively.

$$
\begin{aligned}
& \therefore\left|\vec{b}_{1}\right|=\sqrt{3^{2}+2^{2}+6^{2}}=7 \\
& \begin{aligned}
\left|\vec{b}_{2}\right|= & \sqrt{(1)^{2}+(2)^{2}+(2)^{2}}=3 \\
\vec{b}_{1} \cdot \vec{b}_{2} & =(3 \hat{i}+2 \hat{j}+6 \hat{k}) \cdot(\hat{i}+2 \hat{j}+2 \hat{k}) \\
& =3 \times 1+2 \times 2+6 \times 2 \\
& =3+4+12 \\
& =19
\end{aligned}
\end{aligned}
$$

$\Rightarrow \cos Q=\frac{19}{7 \times 3}$
$\Rightarrow Q=\cos ^{-1}\left(\frac{19}{21}\right)$
(ii) The given lines are parallel to the vectors, $\vec{b}_{1}=\hat{i}-\hat{j}-2 \hat{k}$ and $\vec{b}_{2}=3 \hat{i}-5 \hat{j}-4 \hat{k}$, respectively.

$$
\begin{aligned}
& \therefore\left|\vec{b}_{1}\right|=\sqrt{(1)^{2}+(-1)^{2}+(-2)^{2}}=\sqrt{6} \\
& \left|\vec{b}_{2}\right|= \\
& \begin{aligned}
\vec{b}_{1} \cdot \vec{b}_{2} & =(\hat{i}-\hat{j}-2 \hat{k}) \cdot(3 \hat{i}-5 \hat{j}-4 \hat{k}) \\
& =1 \cdot 3-1(-5)-2(-4) \\
& =3+5+8 \\
& =16
\end{aligned}
\end{aligned}
$$

$\cos Q=\left|\begin{array}{l}\vec{b}_{1} \cdot \vec{b}_{2} \\ \left|\vec{b}_{1}\right|\left|\vec{b}_{2}\right|\end{array}\right|$
$\Rightarrow \cos Q=\frac{16}{\sqrt{6} \cdot 5 \sqrt{2}}=\frac{16}{\sqrt{2} \cdot \sqrt{3} \cdot 5 \sqrt{2}}=\frac{16}{10 \sqrt{3}}$
$\Rightarrow \cos Q=\frac{8}{5 \sqrt{3}}$
$\Rightarrow Q=\cos ^{-1}\left(\frac{8}{5 \sqrt{3}}\right)$

## Question 11:

Find the angle between the following pairs of lines:
(i) $\frac{x-2}{2}=\frac{y-1}{5}=\frac{z+3}{-3}$ and $\frac{x+2}{-1}=\frac{y-4}{8}=\frac{z-5}{4}$
(ii) $\frac{x}{2}=\frac{y}{2}=\frac{z}{1}$ and $\frac{x-5}{4}=\frac{y-2}{1}=\frac{z-3}{8}$

Answer

Let $\vec{b}_{1}$ and $\vec{b}_{2}$ be the vectors parallel to the pair of lines,

$$
\frac{x-2}{2}=\frac{y-1}{5}=\frac{z+3}{-3} \text { and } \frac{x+2}{-1}=\frac{y-4}{8}=\frac{z-5}{4}, \text { respectively. }
$$

$$
\therefore \vec{b}_{1}=2 \hat{i}+5 \hat{j}-3 \hat{k} \text { and } \vec{b}_{2}=-\hat{i}+8 \hat{j}+4 \hat{k}
$$

$$
\left|\vec{b}_{1}\right|=\sqrt{(2)^{2}+(5)^{2}+(-3)^{2}}=\sqrt{38}
$$

$$
\left|\vec{b}_{2}\right|=\sqrt{(-1)^{2}+(8)^{2}+(4)^{2}}=\sqrt{81}=9
$$

$$
\vec{b}_{1} \cdot \vec{b}_{2}=(2 \hat{i}+5 \hat{j}-3 \hat{k}) \cdot(-\hat{i}+8 \hat{j}+4 \hat{k})
$$

$$
=2(-1)+5 \times 8+(-3) \cdot 4
$$

$$
=-2+40-12
$$

$$
=26
$$

The angle, Q , between the given pair of lines is given by the relation,
$\cos Q=\left|\frac{\vec{b}_{1} \cdot \vec{b}_{2}}{\left|\vec{b}_{1}\right|\left|\vec{b}_{2}\right|}\right|$
$\Rightarrow \cos Q=\frac{26}{9 \sqrt{38}}$
$\Rightarrow Q=\cos ^{-1}\left(\frac{26}{9 \sqrt{38}}\right)$
(ii) Let $\vec{b}_{1}, \vec{b}_{2}$ be the vectors parallel to the given pair of lines, $\frac{x}{2}=\frac{y}{2}=\frac{z}{1}$ and $\frac{x-5}{4}=\frac{y-5}{1}=\frac{z-3}{8}$, respectively.

$$
\begin{aligned}
& \vec{b}_{1}=2 \hat{i}+2 \hat{j}+\hat{k} \\
& \vec{b}_{2}=4 \hat{i}+\hat{j}+8 \hat{k} \\
& \begin{aligned}
\therefore\left|\vec{b}_{1}\right| & =\sqrt{(2)^{2}+(2)^{2}+(1)^{2}}=\sqrt{9}=3 \\
\left|\vec{b}_{2}\right|= & \sqrt{4^{2}+1^{2}+8^{2}}=\sqrt{81}=9 \\
\vec{b}_{1} \cdot \vec{b}_{2} & =(2 \hat{i}+2 \hat{j}+\hat{k}) \cdot(4 \hat{i}+\hat{j}+8 \hat{k}) \\
& =2 \times 4+2 \times 1+1 \times 8 \\
& =8+2+8 \\
& =18
\end{aligned}
\end{aligned}
$$

If Q is the angle between the given pair of lines, then $\cos Q=\left\lvert\, \begin{aligned} & \vec{b}_{1} \cdot \vec{b}_{2} \\ & \left|\vec{b}_{1}\right|\left|\vec{b}_{2}\right|\end{aligned}\right.$
$\Rightarrow \cos Q=\frac{18}{3 \times 9}=\frac{2}{3}$
$\Rightarrow Q=\cos ^{-1}\left(\frac{2}{3}\right)$

## Question 12:

Find the values of $p$ so the line $\frac{1-x}{3}=\frac{7 y-14}{2 p}=\frac{z-3}{2}$ and $\frac{7-7 x}{3 p}=\frac{y-5}{1}=\frac{6-z}{5}$ are at right angles.

Answer
The given equations can be written in the standard form as

$$
\frac{x-1}{-3}=\frac{y-2}{\frac{2 p}{7}}=\frac{z-3}{2} \text { and } \frac{x-1}{\frac{-3 p}{7}}=\frac{y-5}{1}=\frac{z-6}{-5}
$$

The direction ratios of the lines are $-3, \frac{2 p}{7}, 2$ and $\frac{-3 p}{7}, 1,-5$ respectively.
Two lines with direction ratios, $a_{1}, b_{1}, c_{1}$ and $a_{2}, b_{2}, c_{2}$, are perpendicular to each other, if $a_{1} a_{2}+b_{1} b_{2}+c_{1} c_{2}=0$
$\therefore(-3) \cdot\left(\frac{-3 p}{7}\right)+\left(\frac{2 p}{7}\right) \cdot(1)+2 \cdot(-5)=0$
$\Rightarrow \frac{9 p}{7}+\frac{2 p}{7}=10$
$\Rightarrow 11 p=70$
$\Rightarrow p=\frac{70}{11}$

Thus, the value of $p$ is $\frac{70}{11}$.

## Question 13:

Show that the lines $\frac{x-5}{7}=\frac{y+2}{-5}=\frac{z}{1}$ and $\frac{x}{1}=\frac{y}{2}=\frac{z}{3}$ are perpendicular to each other.
Answer
The equations of the given lines are $\frac{x-5}{7}=\frac{y+2}{-5}=\frac{z}{1}$ and $\frac{x}{1}=\frac{y}{2}=\frac{z}{3}$
The direction ratios of the given lines are $7,-5,1$ and $1,2,3$ respectively.
Two lines with direction ratios, $a_{1}, b_{1}, c_{1}$ and $a_{2}, b_{2}, c_{2}$, are perpendicular to each other, if $a_{1} a_{2}+b_{1} b_{2}+c_{1} c_{2}=0$
$\therefore 7 \times 1+(-5) \times 2+1 \times 3$
$=7-10+3$
$=0$
Therefore, the given lines are perpendicular to each other.

## Question 14:

Find the shortest distance between the lines
$\vec{r}=(\hat{i}+2 \hat{j}+\hat{k})+\lambda(\hat{i}-\hat{j}+\hat{k})$ and
$\vec{r}=2 \hat{i}-\hat{j}-\hat{k}+\mu(2 \hat{i}+\hat{j}+2 \hat{k})$

Answer
The equations of the given lines are

$$
\begin{aligned}
& \vec{r}=(\hat{i}+2 \hat{j}+\hat{k})+\lambda(\hat{i}-\hat{j}+\hat{k}) \\
& \vec{r}=2 \hat{i}-\hat{j}-\hat{k}+\mu(2 \hat{i}+\hat{j}+2 \hat{k})
\end{aligned}
$$

It is known that the shortest distance between the lines, $\vec{r}=\vec{a}_{1}+\lambda \vec{b}_{1}$ and $\vec{r}=\vec{a}_{2}+\mu \vec{b}_{2}$, is given by,
$d=\left|\frac{\left(\vec{b}_{1} \times \vec{b}_{2}\right) \cdot\left(\vec{a}_{2}-\vec{a}_{2}\right)}{\left|\vec{b}_{1} \times \vec{b}_{2}\right|}\right|$
Comparing the given equations, we obtain

$$
\begin{aligned}
& \vec{a}_{1}=\hat{i}+2 \hat{j}+\hat{k} \\
& \vec{b}_{1}=\hat{i}-\hat{j}+\hat{k} \\
& \vec{a}_{2}=2 \hat{i}-\hat{j}-\hat{k} \\
& \vec{b}_{2}=2 \hat{i}+\hat{j}+2 \hat{k} \\
& \vec{a}_{2}-\vec{a}_{1}=(2 \hat{i}-\hat{j}-\hat{k})-(\hat{i}+2 \hat{j}+\hat{k})=\hat{i}-3 \hat{j}-2 \hat{k} \\
& \vec{b}_{1} \times \vec{b}_{2}=\left|\begin{array}{|cr}
\hat{i} & \hat{j} \\
1 & -1
\end{array}\right| \begin{array}{l}
\hat{k} \\
2
\end{array} 1 \\
& \vec{b}_{1} \times \vec{b}_{2}=(-2-1) \hat{i}-(2-2) \hat{j}+(1+2) \hat{k}=-3 \hat{i}+3 \hat{k} \\
& \Rightarrow\left|\vec{b}_{1} \times \vec{b}_{2}\right|=\sqrt{(-3)^{2}+(3)^{2}}=\sqrt{9+9}=\sqrt{18}=3 \sqrt{2}
\end{aligned}
$$

Substituting all the values in equation (1), we obtain
$d=\left|\frac{(-3 \hat{i}+3 \hat{k}) \cdot(\hat{i}-3 \hat{j}-2 \hat{k})}{3 \sqrt{2}}\right|$
$\Rightarrow d=\left|\frac{-3.1+3(-2)}{3 \sqrt{2}}\right|$
$\Rightarrow d=\left|\frac{-9}{3 \sqrt{2}}\right|$
$\Rightarrow d=\frac{3}{\sqrt{2}}=\frac{3 \times \sqrt{2}}{\sqrt{2} \times \sqrt{2}}=\frac{3 \sqrt{2}}{2}$
Therefore, the shortest distance between the two lines is $\frac{3 \sqrt{2}}{2}$ units.

## Question 15:

Find the shortest distance between the lines $\frac{x+1}{7}=\frac{y+1}{-6}=\frac{z+1}{1}$ and $\frac{x-3}{1}=\frac{y-5}{-2}=\frac{z-7}{1}$ Answer

The given lines are $\frac{x+1}{7}=\frac{y+1}{-6}=\frac{z+1}{1}$ and $\frac{x-3}{1}=\frac{y-5}{-2}=\frac{z-7}{1}$
It is known that the shortest distance between the two lines,
$\frac{x-x_{1}}{a_{1}}=\frac{y-y_{1}}{b_{1}}=\frac{z-z_{1}}{c_{1}}$ and $\frac{x-x_{2}}{a_{2}}=\frac{y-y_{2}}{b_{2}}=\frac{z-z_{2}}{c_{2}}$, is given by,
$d=\frac{\left|\begin{array}{ccc}x_{2}-x_{1} & y_{2}-y_{1} & z_{2}-z_{1} \\ a_{1} & b_{1} & c_{1} \\ a_{2} & b_{2} & c_{2}\end{array}\right|}{\sqrt{\left(b_{1} c_{2}-b_{2} c_{1}\right)^{2}+\left(c_{1} a_{2}-c_{2} a_{1}\right)^{2}+\left(a_{1} b_{2}-a_{2} b_{1}\right)^{2}}}$
Comparing the given equations, we obtain

$$
\begin{aligned}
& x_{1}=-1, y_{1}=-1, z_{1}=-1 \\
& a_{1}=7, \quad b_{1}=-6, c_{1}=1 \\
& x_{2}=3, y_{2}=5, z_{2}=7 \\
& a_{2}=1, \quad b_{2}=-2, c_{2}=1 \\
& \text { Then, }\left|\begin{array}{ccc}
x_{2}-x_{1} & y_{2}-y_{1} & z_{2}-z_{1} \\
a_{1} & b_{1} & c_{1} \\
a_{2} & b_{2} & c_{2}
\end{array}\right|=\left|\begin{array}{lll}
4 & 6 & 8 \\
7 & -6 & 1 \\
1 & -2 & 1
\end{array}\right| \\
& =4(-6+2)-6(7-1)+8(-14+6) \\
& =-16-36-64 \\
& =-116 \\
& \Rightarrow \sqrt{\left(b_{1} c_{2}-b_{2} c_{1}\right)^{2}+\left(c_{1} a_{2}-c_{2} a_{1}\right)^{2}+\left(a_{1} b_{2}-a_{2} b_{1}\right)^{2}}=\sqrt{(-6+2)^{2}+(1+7)^{2}+(-14+6)^{2}} \\
& =\sqrt{16+36+64} \\
& =\sqrt{116} \\
& =2 \sqrt{29}
\end{aligned}
$$

Substituting all the values in equation (1), we obtain
$d=\frac{-116}{2 \sqrt{29}}=\frac{-58}{\sqrt{29}}=\frac{-2 \times 29}{\sqrt{29}}=-2 \sqrt{29}$
Since distance is always non-negative, the distance between the given lines is $2 \sqrt{29}$ units.

## Question 16:

Find the shortest distance between the lines whose vector equations are
$\vec{r}=(\hat{i}+2 \hat{j}+3 \hat{k})+\lambda(\hat{i}-3 \hat{j}+2 \hat{k})$
and $\vec{r}=4 \hat{i}+5 \hat{j}+6 \hat{k}+\mu(2 \hat{i}+3 \hat{j}+\hat{k})$
Answer

The given lines are $\vec{r}=\hat{i}+2 \hat{j}+3 \hat{k}+\lambda(\hat{i}-3 \hat{j}+2 \hat{k})$ and $\vec{r}=4 \hat{i}+5 \hat{j}+6 \hat{k}+\mu(2 \hat{i}+3 \hat{j}+\hat{k})$
It is known that the shortest distance between the lines, $\vec{r}=\vec{a}_{1}+\lambda \vec{b}_{1}$ and $\vec{r}=\vec{a}_{2}+\mu \vec{b}_{2}$, is given by,
$d=\left|\frac{\left(\vec{b}_{1} \times \vec{b}_{2}\right) \cdot\left(\vec{a}_{2}-\vec{a}_{2}\right)}{\left|\vec{b}_{1} \times \vec{b}_{2}\right|}\right|$
Comparing the given equations with $\vec{r}=\vec{a}_{1}+\lambda \vec{b}_{1}$ and $\vec{r}=\vec{a}_{2}+\mu \vec{b}_{2}$, we obtain

$$
\begin{aligned}
& \vec{a}_{1}=\hat{i}+2 \hat{j}+3 \hat{k} \\
& \vec{b}_{1}=\hat{i}-3 \hat{j}+2 \hat{k} \\
& \vec{a}_{2}=4 \hat{i}+5 \hat{j}+6 \hat{k} \\
& \vec{b}_{2}=2 \hat{i}+3 \hat{j}+\hat{k} \\
& \vec{a}_{2}-\vec{a}_{1}=(4 \hat{i}+5 \hat{j}+6 \hat{k})-(\hat{i}+2 \hat{j}+3 \hat{k})=3 \hat{i}+3 \hat{j}+3 \hat{k} \\
& \vec{b}_{1} \times \vec{b}_{2}=\left|\begin{array}{lll}
\hat{i} & \hat{j} & \hat{k} \\
1 & -3 & 2 \\
2 & 3 & 1
\end{array}\right|=(-3-6) \hat{i}-(1-4) \hat{j}+(3+6) \hat{k}=-9 \hat{i}+3 \hat{j}+9 \hat{k} \\
& \Rightarrow\left|\vec{b}_{1} \times \vec{b}_{2}\right|=\sqrt{(-9)^{2}+(3)^{2}+(9)^{2}}=\sqrt{81+9+81}=\sqrt{171}=3 \sqrt{19} \\
& \left(\vec{b}_{1} \times \vec{b}_{2}\right) \cdot\left(\vec{a}_{2}-\vec{a}_{1}\right)=(-9 \hat{i}+3 \hat{j}+9 \hat{k}) \cdot(3 \hat{i}+3 \hat{j}+3 \hat{k}) \\
& =-9 \times 3+3 \times 3+9 \times 3 \\
& =9
\end{aligned}
$$

Substituting all the values in equation (1), we obtain
$d=\left|\frac{9}{3 \sqrt{19}}\right|=\frac{3}{\sqrt{19}}$

Therefore, the shortest distance between the two given lines is $\frac{3}{\sqrt{19}}$ units.

## Question 17:

Find the shortest distance between the lines whose vector equations are
$\vec{r}=(1-t) \hat{i}+(t-2) \hat{j}+(3-2 t) \hat{k}$ and
$\vec{r}=(s+1) \hat{i}+(2 s-1) \hat{j}-(2 s+1) \hat{k}$
Answer
The given lines are
$\vec{r}=(1-t) \hat{i}+(t-2) \hat{j}+(3-2 t) \hat{k}$
$\Rightarrow \vec{r}=(\hat{i}-2 \hat{j}+3 \hat{k})+t(-\hat{i}+\hat{j}-2 \hat{k})$
$\vec{r}=(s+1) \hat{i}+(2 s-1) \hat{j}-(2 s+1) \hat{k}$
$\Rightarrow \vec{r}=(\hat{i}-\hat{j}+\hat{k})+s(\hat{i}+2 \hat{j}-2 \hat{k})$

It is known that the shortest distance between the lines, $\vec{r}=\vec{a}_{1}+\lambda \vec{b}_{1}$ and $\vec{r}=\vec{a}_{2}+\mu \vec{b}_{2}$, is given by,
$d=\left|\frac{\left(\vec{b}_{1} \times \vec{b}_{2}\right) \cdot\left(\vec{a}_{2}-\vec{a}_{2}\right)}{\left|\vec{b}_{1} \times \vec{b}_{2}\right|}\right|$
For the given equations,
$\vec{a}_{1}=\hat{i}-2 \hat{j}+3 \hat{k}$
$\vec{b}_{1}=-\hat{i}+\hat{j}-2 \hat{k}$
$\vec{a}_{2}=\hat{i}-\hat{j}-\hat{k}$
$\vec{b}_{2}=\hat{i}+2 \hat{j}-2 \hat{k}$
$\vec{a}_{2}-\vec{a}_{1}=(\hat{i}-\hat{j}-\hat{k})-(\hat{i}-2 \hat{j}+3 \hat{k})=\hat{j}-4 \hat{k}$
$\vec{b}_{1} \times \vec{b}_{2}=\left|\begin{array}{lll}\hat{i} & \hat{j} & \hat{k} \\ -1 & 1 & -2 \\ 1 & 2 & -2\end{array}\right|=(-2+4) \hat{i}-(2+2) \hat{j}+(-2-1) \hat{k}=2 \hat{i}-4 \hat{j}-3 \hat{k}$
$\Rightarrow\left|\vec{b}_{1} \times \vec{b}_{2}\right|=\sqrt{(2)^{2}+(-4)^{2}+(-3)^{2}}=\sqrt{4+16+9}=\sqrt{29}$
$\therefore\left(\vec{b}_{1} \times \vec{b}_{2}\right) \cdot\left(\vec{a}_{2}-\vec{a}_{1}\right)=(2 \hat{i}-4 \hat{j}-3 \hat{k}) \cdot(\hat{j}-4 \hat{k})=-4+12=8$
Substituting all the values in equation (3), we obtain
$d=\left|\frac{8}{\sqrt{29}}\right|=\frac{8}{\sqrt{29}}$

Therefore, the shortest distance between the lines is $\frac{8}{\sqrt{29}}$ units.

## Exercise 11.3

## Question 1:

In each of the following cases, determine the direction cosines of the normal to the plane and the distance from the origin.
(a)z $=2$ (b) $x+y+z=1$
(c) $2 x+3 y-z=5$ (d) $5 y+8=0$

Answer
(a) The equation of the plane is $z=2$ or $0 x+0 y+z=2 \ldots$ (1)

The direction ratios of normal are 0,0 , and 1.
$\therefore \sqrt{0^{2}+0^{2}+1^{2}}=1$

Dividing both sides of equation (1) by 1 , we obtain
$0 . x+0 . y+1 . z=2$
This is of the form $l x+m y+n z=d$, where $I, m, n$ are the direction cosines of normal to the plane and $d$ is the distance of the perpendicular drawn from the origin.
Therefore, the direction cosines are 0,0 , and 1 and the distance of the plane from the origin is 2 units.
(b) $x+y+z=1$

The direction ratios of normal are 1,1 , and 1.
$\therefore \sqrt{(1)^{2}+(1)^{2}+(1)^{2}}=\sqrt{3}$

Dividing both sides of equation (1) by $\sqrt{3}$, we obtain
$\frac{1}{\sqrt{3}} x+\frac{1}{\sqrt{3}} y+\frac{1}{\sqrt{3}} z=\frac{1}{\sqrt{3}}$

This equation is of the form $l x+m y+n z=d$, where $I, m, n$ are the direction cosines of normal to the plane and $d$ is the distance of normal from the origin.

Therefore, the direction cosines of the normal are $\frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}}$, and $\frac{1}{\sqrt{3}}$ and the distance of normal from the origin is $\frac{1}{\sqrt{3}}$ units.
(c) $2 x+3 y-z=5$

The direction ratios of normal are 2,3 , and -1 .
$\therefore \sqrt{(2)^{2}+(3)^{2}+(-1)^{2}}=\sqrt{14}$
Dividing both sides of equation (1) by $\sqrt{14}$, we obtain
$\frac{2}{\sqrt{14}} x+\frac{3}{\sqrt{14}} y-\frac{1}{\sqrt{14}} z=\frac{5}{\sqrt{14}}$
This equation is of the form $I x+m y+n z=d$, where $I, m, n$ are the direction cosines of normal to the plane and $d$ is the distance of normal from the origin.

Therefore, the direction cosines of the normal to the plane are $\frac{2}{\sqrt{14}}, \frac{3}{\sqrt{14}}$, and $\frac{-1}{\sqrt{14}}$ and the distance of normal from the origin is $\frac{5}{\sqrt{14}}$ units.
(d) $5 y+8=0$
$\Rightarrow 0 x-5 y+0 z=8 \ldots$ (1)

The direction ratios of normal are $0,-5$, and 0 .
$\therefore \sqrt{0+(-5)^{2}+0}=5$
Dividing both sides of equation (1) by 5 , we obtain
$-y=\frac{8}{5}$

This equation is of the form $l x+m y+n z=d$, where $I, m, n$ are the direction cosines of normal to the plane and $d$ is the distance of normal from the origin.

Therefore, the direction cosines of the normal to the plane are $0,-1$, and 0 and the
distance of normal from the origin is $\frac{8}{5}$ units.

## Question 2:

Find the vector equation of a plane which is at a distance of 7 units from the origin and normal to the vector $3 \hat{i}+5 \hat{j}-6 \hat{k}$.

Answer

The normal vector is, $\vec{n}=3 \hat{i}+5 \hat{j}-6 \hat{k}$
$\therefore \hat{n}=\frac{\vec{n}}{|\vec{n}|}=\frac{3 \hat{i}+5 \hat{j}-6 \hat{k}}{\sqrt{(3)^{2}+(5)^{2}+(6)^{2}}}=\frac{3 \hat{i}+5 \hat{j}-6 \hat{k}}{\sqrt{70}}$
It is known that the equation of the plane with position vector $\vec{r}$ is given by, $\vec{r} \cdot \hat{n}=d$
$\Rightarrow \hat{r} \cdot\left(\frac{3 \hat{i}+5 \hat{j}-6 \hat{k}}{\sqrt{70}}\right)=7$
This is the vector equation of the required plane.

## Question 3:

Find the Cartesian equation of the following planes:
(a) $\vec{r} \cdot(\hat{i}+\hat{j}-\hat{k})=2$ (b) $\vec{r} \cdot(2 \hat{i}+3 \hat{j}-4 \hat{k})=1$
(c) $\vec{r} \cdot[(s-2 t) \hat{i}+(3-t) \hat{j}+(2 s+t) \hat{k}]=15$

Answer
(a) It is given that equation of the plane is
$\vec{r} \cdot(\hat{i}+\hat{j}-\hat{k})=2$
For any arbitrary point $\mathrm{P}(x, y, z)$ on the plane, position vector $\vec{r}$ is given by, $\vec{r}=x \hat{i}+y \hat{j}-z \hat{k}$

Substituting the value of $\vec{r}$ in equation (1), we obtain
$(x \hat{i}+y \hat{j}-z \hat{k}) \cdot(\hat{i}+\hat{j}-\hat{k})=2$
$\Rightarrow x+y-z=2$
This is the Cartesian equation of the plane.
(b) $\vec{r} \cdot(2 \hat{i}+3 \hat{j}-4 \hat{k})=1$

For any arbitrary point $\mathrm{P}(x, y, z)$ on the plane, position vector $\vec{r}$ is given by, $\vec{r}=x \hat{i}+y \hat{j}-z \hat{k}$

Substituting the value of $\vec{r}$ in equation (1), we obtain
$(x \hat{i}+y \hat{j}+z \hat{k}) \cdot(2 \hat{i}+3 \hat{j}-4 \hat{k})=1$
$\Rightarrow 2 x+3 y-4 z=1$
This is the Cartesian equation of the plane.
(c) $\vec{r} \cdot[(s-2 t) \hat{i}+(3-t) \hat{j}+(2 s+t) \hat{k}]=15$

For any arbitrary point $\mathrm{P}(x, y, z)$ on the plane, position vector $\vec{r}$ is given by,
$\vec{r}=x \hat{i}+y \hat{j}-z \hat{k}$
Substituting the value of $\vec{r}$ in equation (1), we obtain
$(x \hat{i}+y \hat{j}-z \hat{k}) \cdot[(s-2 t) \hat{i}+(3-t) \hat{j}+(2 s+t) \hat{k}]=15$
$\Rightarrow(s-2 t) x+(3-t) y+(2 s+t) z=15$
This is the Cartesian equation of the given plane.

## Question 4:

In the following cases, find the coordinates of the foot of the perpendicular drawn from the origin.
(a) $2 x+3 y+4 z-12=0$
(b) $3 y+4 z-6=0$
(C) $x+y+z=1$
(d) $5 y+8=0$

Answer
(a) Let the coordinates of the foot of perpendicular $P$ from the origin to the plane be $\left(x_{1}, y_{1}, z_{1}\right)$.
$2 x+3 y+4 z-12=0$
$\Rightarrow 2 x+3 y+4 z=12$

The direction ratios of normal are 2,3 , and 4 .
$\therefore \sqrt{(2)^{2}+(3)^{2}+(4)^{2}}=\sqrt{29}$

Dividing both sides of equation (1) by $\sqrt{29}$, we obtain
$\frac{2}{\sqrt{29}} x+\frac{3}{\sqrt{29}} y+\frac{4}{\sqrt{29}} z=\frac{12}{\sqrt{29}}$
This equation is of the form $l x+m y+n z=d$, where $l, m, n$ are the direction cosines of normal to the plane and $d$ is the distance of normal from the origin.
The coordinates of the foot of the perpendicular are given by (ld, md, nd).
Therefore, the coordinates of the foot of the perpendicular are
$\left(\frac{2}{\sqrt{29}} \cdot \frac{12}{\sqrt{29}}, \frac{3}{\sqrt{29}} \cdot \frac{12}{\sqrt{29}}, \frac{4}{\sqrt{29}} \cdot \frac{12}{\sqrt{29}}\right)$ i.e., $\left(\frac{24}{29}, \frac{36}{49}, \frac{48}{29}\right)$.
(b) Let the coordinates of the foot of perpendicular P from the origin to the plane be $\left(x_{1}\right.$, $\left.y_{1}, z_{1}\right)$.
$3 y+4 z-6=0$
$\Rightarrow 0 x+3 y+4 z=6$.

The direction ratios of the normal are 0,3 , and 4.
$\therefore \sqrt{0+3^{2}+4^{2}}=5$
Dividing both sides of equation (1) by 5 , we obtain
$0 x+\frac{3}{5} y+\frac{4}{5} z=\frac{6}{5}$

This equation is of the form $I x+m y+n z=d$, where $I, m, n$ are the direction cosines of normal to the plane and $d$ is the distance of normal from the origin.

The coordinates of the foot of the perpendicular are given by ( $l d, m d, n d$ ).

Therefore, the coordinates of the foot of the perpendicular are
$\left(0, \frac{3}{5}, \frac{6}{5}, \frac{4}{5} \cdot \frac{6}{5}\right)$ i.e., $\left(0, \frac{18}{25}, \frac{24}{25}\right)$.
(c) Let the coordinates of the foot of perpendicular P from the origin to the plane be ( $x_{1}$, $y_{1}, z_{1}$ ).
$x+y+z=1$
The direction ratios of the normal are 1,1 , and 1 .
$\therefore \sqrt{1^{2}+1^{2}+1^{2}}=\sqrt{3}$
Dividing both sides of equation (1) by $\sqrt{3}$, we obtain
$\frac{1}{\sqrt{3}} x+\frac{1}{\sqrt{3}} y+\frac{1}{\sqrt{3}} z=\frac{1}{\sqrt{3}}$
This equation is of the form $I x+m y+n z=d$, where $I, m, n$ are the direction cosines of normal to the plane and $d$ is the distance of normal from the origin.

The coordinates of the foot of the perpendicular are given by
(ld, md, nd).
Therefore, the coordinates of the foot of the perpendicular are
$\left(\frac{1}{\sqrt{3}} \cdot \frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}} \cdot \frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}} \cdot \frac{1}{\sqrt{3}}\right)$ i.e., $\left(\frac{1}{3}, \frac{1}{3}, \frac{1}{3}\right)$.
(d) Let the coordinates of the foot of perpendicular P from the origin to the plane be ( $x_{1}$, $y_{1}, z_{1}$ ).
$5 y+8=0$
$\Rightarrow 0 x-5 y+0 z=8$

The direction ratios of the normal are $0,-5$, and 0 .
$\therefore \sqrt{0+(-5)^{2}+0}=5$
Dividing both sides of equation (1) by 5 , we obtain
$-y=\frac{8}{5}$
This equation is of the form $I x+m y+n z=d$, where $I, m, n$ are the direction cosines of normal to the plane and $d$ is the distance of normal from the origin.

The coordinates of the foot of the perpendicular are given by
( $I d, m d, n d$ ).
Therefore, the coordinates of the foot of the perpendicular are
$\left(0,-1\left(\frac{8}{5}\right), 0\right)$ i.e., $\left(0,-\frac{8}{5}, 0\right)$.

## Question 5:

Find the vector and Cartesian equation of the planes
(a) that passes through the point $(1,0,-2)$ and the normal to the plane is $\hat{i}+\hat{j}-\hat{k}$.
(b) that passes through the point $(1,4,6)$ and the normal vector to the plane is $\hat{i}-2 \hat{j}+\hat{k}$.

Answer
(a) The position vector of point $(1,0,-2)$ is $\vec{a}=\hat{i}-2 \hat{k}$

The normal vector $\vec{N}$ perpendicular to the plane is $\vec{N}=\hat{i}+\hat{j}-\hat{k}$

The vector equation of the plane is given by, $(\vec{r}-\vec{a}) \cdot \vec{N}=0$
$\Rightarrow[\vec{r}-(\hat{i}-2 \hat{k})] \cdot(\hat{i}+\hat{j}-\hat{k})=0$
$\vec{r}$ is the position vector of any point $\mathrm{P}(x, y, z)$ in the plane.
$\therefore \vec{r}=x \hat{i}+y \hat{j}+z \hat{k}$
Therefore, equation (1) becomes

$$
\begin{aligned}
& {[(x \hat{i}+y \hat{j}+z \hat{k})-(\hat{i}-2 \hat{k})] \cdot(\hat{i}+\hat{j}-\hat{k})=0} \\
& \Rightarrow[(x-1) \hat{i}+y \hat{j}+(z+2) \hat{k}] \cdot(\hat{i}+\hat{j}-\hat{k})=0 \\
& \Rightarrow(x-1)+y-(z+2)=0 \\
& \Rightarrow x+y-z-3=0 \\
& \Rightarrow x+y-z=3
\end{aligned}
$$

This is the Cartesian equation of the required plane.
(b) The position vector of the point $(1,4,6)$ is $\vec{a}=\hat{i}+4 \hat{j}+6 \hat{k}$

The normal vector $\vec{N}$ perpendicular to the plane is $\vec{N}=\hat{i}-2 \hat{j}+\hat{k}$
The vector equation of the plane is given by, $(\vec{r}-\vec{a}) \cdot \vec{N}=0$

$$
\begin{equation*}
\Rightarrow[\vec{r}-(\hat{i}+4 \hat{j}+6 \hat{k})] \cdot(\hat{i}-2 \hat{j}+\hat{k})=0 \tag{1}
\end{equation*}
$$

$\vec{r}$ is the position vector of any point $\mathrm{P}(x, y, z)$ in the plane.
$\therefore \vec{r}=x \hat{i}+y \hat{j}+z \hat{k}$
Therefore, equation (1) becomes

$$
\begin{aligned}
& {[(x \hat{i}+y \hat{j}+z \hat{k})-(\hat{i}+4 \hat{j}+6 \hat{k})] \cdot(\hat{i}-2 \hat{j}+\hat{k})=0} \\
& \Rightarrow[(x-1) \hat{i}+(y-4) \hat{j}+(z-6) \hat{k}] \cdot(\hat{i}-2 \hat{j}+\hat{k})=0 \\
& \Rightarrow(x-1)-2(y-4)+(z-6)=0 \\
& \Rightarrow x-2 y+z+1=0
\end{aligned}
$$

This is the Cartesian equation of the required plane.

## Question 6:

Find the equations of the planes that passes through three points.
(a) $(1,1,-1),(6,4,-5),(-4,-2,3)$
(b) $(1,1,0),(1,2,1),(-2,2,-1)$

Answer
(a) The given points are $A(1,1,-1), B(6,4,-5)$, and $C(-4,-2,3)$.

$$
\begin{aligned}
\left|\begin{array}{lll}
1 & 1 & -1 \\
6 & 4 & -5 \\
-4 & -2 & 3
\end{array}\right| & =(12-10)-(18-20)-(-12+16) \\
& =2+2-4 \\
& =0
\end{aligned}
$$

Since A, B, C are collinear points, there will be infinite number of planes passing through the given points.
(b) The given points are $A(1,1,0), B(1,2,1)$, and $C(-2,2,-1)$.
$\left|\begin{array}{lll}1 & 1 & 0 \\ 1 & 2 & 1 \\ -2 & 2 & -1\end{array}\right|=(-2-2)-(2+2)=-8 \neq 0$
Therefore, a plane will pass through the points $A, B$, and $C$.
It is known that the equation of the plane through the points, $\left(x_{1}, y_{1}, z_{1}\right),\left(x_{2}, y_{2}, z_{2}\right)$, and

$$
\begin{aligned}
& \left(x_{3}, y_{3}, z_{3}\right), \text { is } \\
& \left|\begin{array}{lll}
x-x_{1} & y-y_{1} & z-z_{1} \\
x_{2}-x_{1} & y_{2}-y_{1} & z_{2}-z_{1} \\
x_{3}-x_{1} & y_{3}-y_{1} & z_{3}-z_{1}
\end{array}\right|=0 \\
& \Rightarrow\left|\begin{array}{ccc}
x-1 & y-1 & z \\
0 & 1 & 1 \\
-3 & 1 & -1
\end{array}\right|=0 \\
& \Rightarrow(-2)(x-1)-3(y-1)+3 z=0 \\
& \Rightarrow-2 x-3 y+3 z+2+3=0 \\
& \Rightarrow-2 x-3 y+3 z=-5 \\
& \Rightarrow 2 x+3 y-3 z=5
\end{aligned}
$$

This is the Cartesian equation of the required plane.

## Question 7:

Find the intercepts cut off by the plane $2 x+y-z=5$
Answer
$2 x+y-z=5$

Dividing both sides of equation (1) by 5 , we obtain

$$
\begin{align*}
& \frac{2}{5} x+\frac{y}{5}-\frac{z}{5}=1 \\
& \Rightarrow \frac{x}{\frac{5}{2}}+\frac{y}{5}+\frac{z}{-5}=1 \tag{2}
\end{align*}
$$

It is known that the equation of a plane in intercept form is $\frac{x}{a}+\frac{y}{b}+\frac{z}{c}=1$, where $a, b, c$ are the intercepts cut off by the plane at $x, y$, and $z$ axes respectively.

Therefore, for the given equation,
$a=\frac{5}{2}, b=5$, and $c=-5$

Thus, the intercepts cut off by the plane are $\frac{5}{2}, 5$, and -5 .

## Question 8:

Find the equation of the plane with intercept 3 on the $y$-axis and parallel to ZOX plane.
Answer
The equation of the plane ZOX is
$y=0$
Any plane parallel to it is of the form, $y=a$
Since the $y$-intercept of the plane is 3 ,
$\therefore a=3$

Thus, the equation of the required plane is $y=3$

## Question 9:

Find the equation of the plane through the intersection of the planes
$3 x-y+2 z-4=0$ and $x+y+z-2=0$ and the point $(2,2,1)$
Answer

The equation of any plane through the intersection of the planes,
$3 x-y+2 z-4=0$ and $x+y+z-2=0$, is
$(3 x-y+2 z-4)+\alpha(x+y+z-2)=0$, where $\alpha \in \mathrm{R}$
The plane passes through the point $(2,2,1)$. Therefore, this point will satisfy equation (1).

$$
\begin{aligned}
& \therefore(3 \times 2-2+2 \times 1-4)+\alpha(2+2+1-2)=0 \\
& \Rightarrow 2+3 \alpha=0 \\
& \Rightarrow \alpha=-\frac{2}{3}
\end{aligned}
$$

Substituting $\alpha=-\frac{2}{3}$ in equation (1), we obtain
$(3 x-y+2 z-4)-\frac{2}{3}(x+y+z-2)=0$
$\Rightarrow 3(3 x-y+2 z-4)-2(x+y+z-2)=0$
$\Rightarrow(9 x-3 y+6 z-12)-2(x+y+z-2)=0$
$\Rightarrow 7 x-5 y+4 z-8=0$
This is the required equation of the plane.

## Question 10:

Find the vector equation of the plane passing through the intersection of the planes
$\vec{r} \cdot(2 \hat{i}+2 \hat{j}-3 \hat{k})=7, \quad \vec{r} \cdot(2 \hat{i}+5 \hat{j}+3 \hat{k})=9$ and through the point $(2,1,3)$
Answer

The equations of the planes are $\vec{r} \cdot(2 \hat{i}+2 \hat{j}-3 \hat{k})=7$ and $\vec{r} \cdot(2 \hat{i}+5 \hat{j}+3 \hat{k})=9$
$\Rightarrow \vec{r} \cdot(2 \hat{i}+2 \hat{j}-3 \hat{k})-7=0$
$\vec{r} \cdot(2 \hat{i}+5 \hat{j}+3 \hat{k})-9=0$
The equation of any plane through the intersection of the planes given in equations (1) and (2) is given by,
$[\vec{r} \cdot(2 \hat{i}+2 \hat{j}-3 \hat{k})-7]+\lambda[\vec{r} \cdot(2 \hat{i}+5 \hat{j}+3 \hat{k})-9]=0$, where $\lambda \in R$

$$
\begin{align*}
& \vec{r} \cdot[(2 \hat{i}+2 \hat{j}-3 \hat{k})+\lambda(2 \hat{i}+5 \hat{j}+3 \hat{k})]=9 \lambda+7 \\
& \vec{r} \cdot[(2+2 \lambda) \hat{i}+(2+5 \lambda) \hat{j}+(3 \lambda-3) \hat{k}]=9 \lambda+7 \tag{3}
\end{align*}
$$

The plane passes through the point $(2,1,3)$. Therefore, its position vector is given by, $\vec{r}=2 \hat{i}+2 \hat{j}+3 \hat{k}$

Substituting in equation (3), we obtain
$(2 \hat{i}+\hat{j}-3 \hat{k}) \cdot[(2+2 \lambda) \hat{i}+(2+5 \lambda) \hat{j}+(3 \lambda-3) \hat{k}]=9 \lambda+7$
$\Rightarrow(2+2 \lambda)+(2+5 \lambda)+(3 \lambda-3)=9 \lambda+7$
$\Rightarrow 18 \lambda-3=9 \lambda+7$
$\Rightarrow 9 \lambda=10$
$\Rightarrow \lambda=\frac{10}{9}$

Substituting $\lambda=\frac{10}{9}$ in equation (3), we obtain
$\vec{r} \cdot\left(\frac{38}{9} \hat{i}+\frac{68}{9} \hat{j}+\frac{3}{9} \hat{k}\right)=17$
$\Rightarrow \vec{r} \cdot(38 \hat{i}+68 \hat{j}+3 \hat{k})=153$
This is the vector equation of the required plane.

## Question 11:

Find the equation of the plane through the line of intersection of the planes
$x+y+z=1$ and $2 x+3 y+4 z=5$ which is perpendicular to the plane $x-y+z=0$
Answer
The equation of the plane through the intersection of the planes, $x+y+z=1$ and
$2 x+3 y+4 z=5$, is
$(x+y+z-1)+\lambda(2 x+3 y+4 z-5)=0$
$\Rightarrow(2 \lambda+1) x+(3 \lambda+1) y+(4 \lambda+1) z-(5 \lambda+1)=0$
The direction ratios, $a_{1}, b_{1}, c_{1}$, of this plane are $(2 \lambda+1),(3 \lambda+1)$, and $(4 \lambda+1)$.
The plane in equation (1) is perpendicular to $x-y+z=0$

Its direction ratios, $a_{2}, b_{2}, c_{2}$, are $1,-1$, and 1 .
Since the planes are perpendicular,
$a_{1} a_{2}+b_{1} b_{2}+c_{1} c_{2}=0$
$\Rightarrow(2 \lambda+1)-(3 \lambda+1)+(4 \lambda+1)=0$
$\Rightarrow 3 \lambda+1=0$
$\Rightarrow \lambda=-\frac{1}{3}$

Substituting $\lambda=-\frac{1}{3}$ in equation (1), we obtain
$\frac{1}{3} x-\frac{1}{3} z+\frac{2}{3}=0$
$\Rightarrow x-z+2=0$
This is the required equation of the plane.

## Question 12:

Find the angle between the planes whose vector equations are
$\vec{r} \cdot(2 \hat{i}+2 \hat{j}-3 \hat{k})=5$ and $\vec{r} \cdot(3 \hat{i}-3 \hat{j}+5 \hat{k})=3$
Answer

The equations of the given planes are $\vec{r} \cdot(2 \hat{i}+2 \hat{j}-3 \hat{k})=5$ and $\vec{r} \cdot(3 \hat{i}-3 \hat{j}+5 \hat{k})=3$
It is known that if $\vec{n}_{1}$ and $\vec{n}_{2}$ are normal to the planes, $\vec{r} \cdot \vec{n}_{1}=d_{1}$ and $\vec{r} \cdot \vec{n}_{2}=d_{2}$, then the angle between them, Q , is given by,
$\cos Q=\left|\frac{\vec{n}_{1} \cdot \vec{n}_{2}}{\left|\vec{n}_{1}\right|\left|\vec{n}_{2}\right|}\right|$
Here, $\vec{n}_{1}=2 \hat{i}+2 \hat{j}-3 \hat{k}$ and $\vec{n}_{2}=3 \hat{i}-3 \hat{j}+5 \hat{k}$
$\therefore \vec{n}_{1} \cdot \vec{n}_{2}=(2 \hat{i}+2 \hat{j}-3 \hat{k})(3 \hat{i}-3 \hat{j}+5 \hat{k})=2 \cdot 3+2 \cdot(-3)+(-3) \cdot 5=-15$
$\left|\vec{n}_{1}\right|=\sqrt{(2)^{2}+(2)^{2}+(-3)^{2}}=\sqrt{17}$
$\left|\vec{n}_{2}\right|=\sqrt{(3)^{2}+(-3)^{2}+(5)^{2}}=\sqrt{43}$

Substituting the value of $\vec{n} \cdot \vec{n}_{2},\left|\vec{n}_{1}\right|$ and $\left|\vec{n}_{2}\right|$ in equation (1), we obtain
$\cos Q=\left|\frac{-15}{\sqrt{17} \cdot \sqrt{43}}\right|$
$\Rightarrow \cos Q=\frac{15}{\sqrt{731}}$
$\Rightarrow \cos Q^{-1}=\left(\frac{15}{\sqrt{731}}\right)$

## Question 13:

In the following cases, determine whether the given planes are parallel or perpendicular, and in case they are neither, find the angles between them.
(a) $7 x+5 y+6 z+30=0$ and $3 x-y-10 z+4=0$
(b) $2 x+y+3 z-2=0$ and $x-2 y+5=0$
(c) $2 x-2 y+4 z+5=0$ and $3 x-3 y+6 z-1=0$
(d) $2 x-y+3 z-1=0$ and $2 x-y+3 z+3=0$
(e) $4 x+8 y+z-8=0$ and $y+z-4=0$

Answer
The direction ratios of normal to the plane, $L_{1}: a_{1} x+b_{1} y+c_{1} z=0$, are $a_{1}, b_{1}, c_{1}$ and
$L_{2}: a_{1} x+b_{2} y+c_{2} z=0$ are $a_{2}, b_{2}, c_{2}$.
$L_{1} \| L_{2}$, if $\frac{a_{1}}{a_{2}}=\frac{b_{1}}{b_{2}}=\frac{c_{1}}{c_{2}}$
$L_{1} \perp L_{2}$, if $a_{1} a_{2}+b_{1} b_{2}+c_{1} c_{2}=0$
The angle between $L_{1}$ and $L_{2}$ is given by,
$Q=\cos ^{-1}\left|\frac{a_{1} a_{2}+b_{1} b_{2}+c_{1} c_{2}}{\sqrt{a_{1}^{2}+b_{1}^{2}+c_{1}^{2} \cdot \sqrt{a_{2}^{2}+b_{2}^{2}+c_{2}^{2}}}}\right|$
(a) The equations of the planes are $7 x+5 y+6 z+30=0$ and
$3 x-y-10 z+4=0$
Here, $a_{1}=7, b_{1}=5, c_{1}=6$
$a_{2}=3, b_{2}=-1, c_{2}=-10$
$a_{1} a_{2}+b_{1} b_{2}+c_{1} c_{2}=7 \times 3+5 \times(-1)+6 \times(-10)=-44 \neq 0$
Therefore, the given planes are not perpendicular.
$\frac{a_{1}}{a_{2}}=\frac{7}{3}, \frac{b_{1}}{b_{2}}=\frac{5}{-1}=-5, \frac{c_{1}}{c_{2}}=\frac{6}{-10}=\frac{-3}{5}$
It can be seen that, $\frac{a_{1}}{a_{2}} \neq \frac{b_{1}}{b_{2}} \neq, \frac{c_{1}}{c_{2}}$
Therefore, the given planes are not parallel.
The angle between them is given by,

$$
\begin{aligned}
Q & =\cos ^{-1}\left|\frac{7 \times 3+5 \times(-1)+6 \times(-10)}{\sqrt{(7)^{2}+(5)^{2}+(6)^{2}} \times \sqrt{(3)^{2}+(-1)^{2}+(-10)^{2}}}\right| \\
& =\cos ^{-1}\left|\frac{21-5-60}{\sqrt{110} \times \sqrt{110}}\right| \\
& =\cos ^{-1} \frac{44}{110} \\
& =\cos ^{-1} \frac{2}{5}
\end{aligned}
$$

(b) The equations of the planes are $2 x+y+3 z-2=0$ and $x-2 y+5=0$

Here, $a_{1}=2, b_{1}=1, c_{1}=3$ and $a_{2}=1, b_{2}=-2, c_{2}=0$
$\therefore a_{1} a_{2}+b_{1} b_{2}+c_{1} c_{2}=2 \times 1+1 \times(-2)+3 \times 0=0$
Thus, the given planes are perpendicular to each other.
(c) The equations of the given planes are $2 x-2 y+4 z+5=0$ and $3 x-3 y+6 z-1=0$

Here, $a_{1}=2, b_{1}-2, c_{1}=4$ and
$a_{2}=3, b_{2}=-3, c_{2}=6 \quad a_{1} a_{2}+b_{1} b_{2}+c_{1} c_{2}=2 \times 3+(-2)(-3)+4 \times 6=6+6+24=36 \neq 0$
Thus, the given planes are not perpendicular to each other.
$\frac{a_{1}}{a_{2}}=\frac{2}{3}, \frac{b_{1}}{b_{2}}=\frac{-2}{-3}=\frac{2}{3}$ and $\frac{c_{1}}{c_{2}}=\frac{4}{6}=\frac{2}{3}$
$\therefore \frac{a_{1}}{a_{2}}=\frac{b_{1}}{b_{2}}=\frac{c_{1}}{c_{2}}$

Thus, the given planes are parallel to each other.
(d) The equations of the planes are $2 x-y+3 z-1=0$ and $2 x-y+3 z+3=0$

Here, $a_{1}=2, b_{1}=-1, c_{1}=3$ and $a_{2}=2, b_{2}=-1, c_{2}=3$
$\frac{a_{1}}{a_{2}}=\frac{2}{2}=1, \frac{b_{1}}{b_{2}}=\frac{-1}{-1}=1$ and $\frac{c_{1}}{c_{2}}=\frac{3}{3}=1$
$\therefore \frac{a_{1}}{a_{2}}=\frac{b_{1}}{b_{2}}=\frac{c_{1}}{c_{2}}$

Thus, the given lines are parallel to each other.
(e) The equations of the given planes are $4 x+8 y+z-8=0$ and $y+z-4=0$

Here, $a_{1}=4, b_{1}=8, c_{1}=1$ and $a_{2}=0, b_{2}=1, c_{2}=1$
$a_{1} a_{2}+b_{1} b_{2}+c_{1} c_{2}=4 \times 0+8 \times 1+1=9 \neq 0$
Therefore, the given lines are not perpendicular to each other.
$\frac{a_{1}}{a_{2}}=\frac{4}{0}, \frac{b_{1}}{b_{2}}=\frac{8}{1}=8, \frac{c_{1}}{c_{2}}=\frac{1}{1}=1$
$\therefore \frac{a_{1}}{a_{2}} \neq \frac{b_{1}}{b_{2}} \neq \frac{c_{1}}{c_{2}}$

Therefore, the given lines are not parallel to each other.
The angle between the planes is given by,
$Q=\cos ^{-1}\left|\frac{4 \times 0+8 \times 1+1 \times 1}{\sqrt{4^{2}+8^{2}+1^{2}} \times \sqrt{0^{2}+1^{2}+1^{2}}}\right|=\cos ^{-1}\left|\frac{9}{9 \times \sqrt{2}}\right|=\cos ^{-1}\left(\frac{1}{\sqrt{2}}\right)=45^{\circ}$

## Question 14:

In the following cases, find the distance of each of the given points from the corresponding given plane.

## Point Plane

(a) $(0,0,0) \quad 3 x-4 y+12 z=3$
(b) $(3,-2,1) \quad 2 x-y+2 z+3=0$
(c) $(2,3,-5) \quad x+2 y-2 z=9$
(d) $(-6,0,0) \quad 2 x-3 y+6 z-2=0$

Answer
It is known that the distance between a point, $p\left(x_{1}, y_{1}, z_{1}\right)$, and a plane, $A x+B y+C z=$ $D$, is given by,
$d=\left|\frac{A x_{1}+B y_{1}+C z_{1}-D}{\sqrt{A^{2}+B^{2}+C^{2}}}\right|$
(a) The given point is $(0,0,0)$ and the plane is $3 x-4 y+12 z=3$
$\therefore d=\left|\frac{3 \times 0-4 \times 0+12 \times 0-3}{\sqrt{(3)^{2}+(-4)^{2}+(12)^{2}}}\right|=\frac{3}{\sqrt{169}}=\frac{3}{13}$
(b) The given point is $(3,-2,1)$ and the plane is $2 x-y+2 z+3=0$
$d=\left|\frac{2 \times 3-(-2)+2 \times 1+3}{\sqrt{(2)^{2}+(-1)^{2}+(2)^{2}}}\right|=\left|\frac{13}{3}\right|=\frac{13}{3}$
(c) The given point is $(2,3,-5)$ and the plane is $x+2 y-2 z=9$
$\therefore d=\left|\frac{2+2 \times 3-2(-5)-9}{\sqrt{(1)^{2}+(2)^{2}+(-2)^{2}}}\right|=\frac{9}{3}=3$
(d) The given point is $(-6,0,0)$ and the plane is $2 x-3 y+6 z-2=0$

$$
d=\left|\frac{2(-6)-3 \times 0+6 \times 0-2}{\sqrt{(2)^{2}+(-3)^{2}+(6)^{2}}}\right|=\left|\frac{-14}{\sqrt{49}}\right|=\frac{14}{7}=2
$$

Miscellaneous Solutions

## Question 1:

Show that the line joining the origin to the point $(2,1,1)$ is perpendicular to the line determined by the points $(3,5,-1),(4,3,-1)$.

Answer
Let $O A$ be the line joining the origin, $O(0,0,0)$, and the point, $A(2,1,1)$.
Also, let $B C$ be the line joining the points, $B(3,5,-1)$ and $C(4,3,-1)$.
The direction ratios of OA are 2,1 , and 1 and of $B C$ are $(4-3)=1,(3-5)=-2$, and $(-1+1)=0$
$O A$ is perpendicular to $B C$, if $a_{1} a_{2}+b_{1} b_{2}+c_{1} c_{2}=0$
$\therefore a_{1} a_{2}+b_{1} b_{2}+c_{1} c_{2}=2 \times 1+1(-2)+1 \times 0=2-2=0$

Thus, $O A$ is perpendicular to $B C$.

## Question 2:

If $I_{1}, m_{1}, n_{1}$ and $I_{2}, m_{2}, n_{2}$ are the direction cosines of two mutually perpendicular lines, show that the direction cosines of the line perpendicular to both of these are $m_{1} n_{2}-$ $m_{2} n_{1}, n_{1} l_{2}-n_{2} l_{1}, l_{1} m_{2}-l_{2} m_{1}$.
Answer
It is given that $I_{1}, m_{1}, n_{1}$ and $I_{2}, m_{2}, n_{2}$ are the direction cosines of two mutually perpendicular lines. Therefore,
$l_{1} l_{2}+m_{1} m_{2}+n_{1} n_{2}=0$
$l_{1}^{2}+m_{1}^{2}+n_{1}^{2}=1$
$l_{2}^{2}+m_{2}^{2}+n_{2}^{2}=1$
Let $l, m, n$ be the direction cosines of the line which is perpendicular to the line with direction cosines $I_{1}, m_{1}, n_{1}$ and $I_{2}, m_{2}, n_{2}$.
$\therefore l_{1}+m m_{1}+n n_{1}=0$
$l_{2}+m m_{2}+n n_{2}=0$
$\therefore \frac{l}{m_{1} n_{2}-m_{2} n_{1}}=\frac{m}{n_{1} l_{2}-n_{2} l_{1}}=\frac{n}{l_{1} m_{2}-l_{2} m_{l}}$
$\Rightarrow \frac{l^{2}}{\left(m_{1} n_{2}-m_{2} n_{1}\right)^{2}}=\frac{m^{2}}{\left(n_{1} l_{2}-n_{2} l_{1}\right)^{2}}=\frac{n^{2}}{\left(l_{1} m_{2}-l_{2} m_{l}\right)^{2}}$
$\Rightarrow \frac{l^{2}}{\left(m_{1} n_{2}-m_{2} n_{1}\right)^{2}}=\frac{m^{2}}{\left(n_{1} l_{2}-n_{2} l_{1}\right)^{2}}=\frac{n^{2}}{\left(l_{1} m_{2}-l_{2} m_{2}\right)^{2}}$
$=\frac{l^{2}+m^{2}+n^{2}}{\left(m_{1} n_{2}-m_{2} n_{1}\right)^{2}+\left(n_{1} l_{2}-n_{2} l_{1}\right)^{2}+\left(l_{1} m_{2}-l_{2} m_{l}\right)^{2}}$
$l, m, n$ are the direction cosines of the line.

$$
\begin{equation*}
\therefore l^{2}+m^{2}+n^{2}=1 . \tag{5}
\end{equation*}
$$

It is known that,

$$
\begin{aligned}
\left(l_{1}^{2}+m_{1}^{2}+n_{1}^{2}\right)\left(l_{2}^{2}+m_{2}^{2}+n_{2}^{2}\right)- & \left(l_{1} l_{2}+m_{1} m_{2}+n_{1} n_{2}\right)^{2} \\
& =\left(m_{1} n_{2}-m_{2} n_{1}\right)^{2}+\left(n_{1} l_{2}-n_{2} l_{1}\right)^{2}+\left(l_{1} m_{2}-l_{2} m_{1}\right)^{2}
\end{aligned}
$$

From (1), (2), and (3), we obtain

$$
\begin{align*}
& \Rightarrow 1.1-0=\left(m_{1} n_{2}+m_{2} n_{1}\right)^{2}+\left(n_{1} l_{2}-n_{2} l_{1}\right)^{2}+\left(l_{1} m_{2}-l_{2} m_{1}\right)^{2} \\
& \therefore\left(m_{1} n_{2}-m_{2} n_{1}\right)^{2}+\left(n_{1} l_{2}-n_{2} l_{1}\right)^{2}+\left(l_{1} m_{2}-l_{2} m_{1}\right)^{2}=1 \tag{6}
\end{align*}
$$

Substituting the values from equations (5) and (6) in equation (4), we obtain

$$
\begin{aligned}
& \frac{l^{2}}{\left(m_{1} n_{2}-m_{2} n_{1}\right)^{2}}=\frac{m^{2}}{\left(n_{2} l_{2}-n_{2} l_{1}\right)^{2}}=\frac{n^{2}}{\left(l_{1} m_{2}-l_{2} m_{1}\right)^{2}}=1 \\
& \Rightarrow l=m_{1} n_{2}-m_{2} n_{1}, m=n_{1} l_{2}-n_{2} l_{1}, n=l_{1} m_{2}-l_{2} m_{1}
\end{aligned}
$$

Thus, the direction cosines of the required line are $m_{1} n_{2}-m_{2} n_{1}, n_{1} l_{2}-n_{2} l_{1}$, and $l_{1} m_{2}-l_{2} m_{1}$.

## Question 3:

Find the angle between the lines whose direction ratios are $a, b, c$ and $b-c$, $c-a, a-b$.

Answer
The angle $Q$ between the lines with direction cosines, $a, b, c$ and $b-c, c-a$, $a-b$, is given by,
$\cos Q=\left|\frac{a(b-c)+b(c-a)+c(a-b)}{\sqrt{a^{2}+b^{2}+c^{2}}+\sqrt{(b-c)^{2}+(c-a)^{2}+(a-b)^{2}}}\right|$
$\Rightarrow \cos Q=0$
$\Rightarrow Q=\cos ^{-1} 0$
$\Rightarrow Q=90^{\circ}$
Thus, the angle between the lines is $90^{\circ}$.

## Question 4:

Find the equation of a line parallel to $x$-axis and passing through the origin.
Answer
The line parallel to $x$-axis and passing through the origin is $x$-axis itself.
Let $A$ be a point on $x$-axis. Therefore, the coordinates of $A$ are given by $(a, 0,0)$, where
$a \in \mathrm{R}$.

Direction ratios of OA are $(a-0)=a, 0,0$
The equation of $O A$ is given by,
$\frac{x-0}{a}=\frac{y-0}{0}=\frac{z-0}{0}$
$\Rightarrow \frac{x}{1}=\frac{y}{0}=\frac{z}{0}=a$
Thus, the equation of line parallel to $x$-axis and passing through origin is
$\frac{x}{1}=\frac{y}{0}=\frac{z}{0}$

## Question 5:

If the coordinates of the points $A, B, C, D$ be $(1,2,3),(4,5,7),(-4,3,-6)$ and $(2,9$, 2) respectively, then find the angle between the lines $A B$ and $C D$.

## Answer

The coordinates of $A, B, C$, and $D$ are $(1,2,3),(4,5,7),(-4,3,-6)$, and $(2,9,2)$ respectively.

The direction ratios of $A B$ are $(4-1)=3,(5-2)=3$, and $(7-3)=4$
The direction ratios of CD are $(2-(-4))=6,(9-3)=6$, and $(2-(-6))=8$
It can be seen that, $\frac{a_{1}}{a_{2}}=\frac{b_{1}}{b_{2}}=\frac{c_{1}}{c_{2}}=\frac{1}{2}$
Therefore, $A B$ is parallel to $C D$.
Thus, the angle between $A B$ and $C D$ is either $0^{\circ}$ or $180^{\circ}$.

## sQuestion 6:

If the lines $\frac{x-1}{-3}=\frac{y-2}{2 k}=\frac{z-3}{2}$ and $\frac{x-1}{3 k}=\frac{y-1}{1}=\frac{z-6}{-5}$ are perpendicular, find the value of $k$.

Answer

The direction of ratios of the lines, $\frac{x-1}{-3}=\frac{y-2}{2 k}=\frac{z-3}{2}$ and $\frac{x-1}{3 k}=\frac{y-1}{1}=\frac{z-6}{-5}$, are -3 , $2 k, 2$ and $3 k, 1,-5$ respectively.
It is known that two lines with direction ratios, $a_{1}, b_{1}, c_{1}$ and $a_{2}, b_{2}, c_{2}$, are perpendicular, if $a_{1} a_{2}+b_{1} b_{2}+c_{1} c_{2}=0$
$\therefore-3(3 k)+2 k \times 1+2(-5)=0$
$\Rightarrow-9 k+2 k-10=0$
$\Rightarrow 7 k=-10$
$\Rightarrow k=\frac{-10}{7}$

Therefore, for $k=-\frac{10}{7}$, the given lines are perpendicular to each other.

## Question 7:

Find the vector equation of the plane passing through $(1,2,3)$ and perpendicular to the
plane $\vec{r} \cdot(\hat{i}+2 \hat{j}-5 \hat{k})+9=0$
Answer
The position vector of the point $(1,2,3)$ is $\vec{r}_{1}=\hat{i}+2 \hat{j}+3 \hat{k}$
The direction ratios of the normal to the plane, $\vec{r} \cdot(\hat{i}+2 \hat{j}-5 \hat{k})+9=0$, are 1,2 , and -5 and the normal vector is $\vec{N}=\hat{i}+2 \hat{j}-5 \hat{k}$
The equation of a line passing through a point and perpendicular to the given plane is
given by, $\vec{l}=\vec{r}+\lambda \vec{N}, \lambda \in R$
$\Rightarrow \vec{l}=(\hat{i}+2 \hat{j}+3 \hat{k})+\lambda(\hat{i}+2 \hat{j}-5 \hat{k})$

## Question 8:

Find the equation of the plane passing through $(a, b, c)$ and parallel to the plane
$\vec{r} \cdot(\hat{i}+\hat{j}+\hat{k})=2$
Answer
Any plane parallel to the plane, $\vec{r}_{1} \cdot(\hat{i}+\hat{j}+\hat{k})=2$, is of the form
$\vec{r} \cdot(\hat{i}+\hat{j}+\hat{k})=\lambda$
The plane passes through the point $(a, b, c)$. Therefore, the position vector $\vec{r}$ of this point is $\vec{r}=a \hat{i}+b \hat{j}+c \hat{k}$
Therefore, equation (1) becomes
$(a \hat{i}+b \hat{j}+c \hat{k}) \cdot(\hat{i}+\hat{j}+\hat{k})=\lambda$
$\Rightarrow a+b+c=\lambda$

Substituting $\lambda=a+b+c$ in equation (1), we obtain
$\vec{r} \cdot(\hat{i}+\hat{j}+\hat{k})=a+b+c$
This is the vector equation of the required plane.
Substituting $\vec{r}=x \hat{i}+y \hat{j}+z \hat{k}$ in equation (2), we obtain
$(x \hat{i}+y \hat{j}+z \hat{k}) \cdot(\hat{i}+\hat{j}+\hat{k})=a+b+c$
$\Rightarrow x+y+z=a+b+c$

## Question 9:

Find the shortest distance between lines $\vec{r}=6 \hat{i}+2 \hat{j}+2 \hat{k}+\lambda(\hat{i}-2 \hat{j}+2 \hat{k})$
and $\vec{r}=-4 \hat{i}-\hat{k}+\mu(3 \hat{i}-2 \hat{j}-2 \hat{k})$.
Answer
The given lines are

$$
\begin{align*}
& \vec{r}=6 \hat{i}+2 \hat{j}+2 \hat{k}+\lambda(\hat{i}-2 \hat{j}+2 \hat{k})  \tag{1}\\
& \vec{r}=-4 \hat{i}-\hat{k}+\mu(3 \hat{i}-2 \hat{j}-2 \hat{k}) \tag{2}
\end{align*}
$$

It is known that the shortest distance between two lines, $\vec{r}=\vec{a}_{1}+\lambda \vec{b}_{1}$ and $\vec{r}=\vec{a}_{2}+\lambda \vec{b}_{2}$, is given by
$d=\left|\frac{\left(\vec{b}_{1} \times \vec{b}_{2}\right) \cdot\left(\vec{a}_{2}-\vec{a}_{1}\right)}{\left|\vec{b}_{1} \times \vec{b}_{2}\right|}\right|$

Comparing $\vec{r}=\vec{a}_{1}+\lambda \vec{b}_{1}$ and $\vec{r}=\vec{a}_{2}+\lambda \vec{b}_{2}$ to equations (1) and (2), we obtain
$\vec{a}_{1}=6 \hat{i}+2 \hat{j}+2 \hat{k}$
$\vec{b}_{1}=\hat{i}-2 \hat{j}+2 \hat{k}$
$\vec{a}_{2}=-4 \hat{i}-\hat{k}$
$\vec{b}_{2}=3 \hat{i}-2 \hat{j}-2 \hat{k}$
$\Rightarrow \vec{a}_{2}-\vec{a}_{1}=(-4 \hat{i}-\hat{k})-(6 \hat{i}+2 \hat{j}+2 \hat{k})=-10 \hat{i}-2 \hat{j}-3 \hat{k}$
$\Rightarrow \vec{b}_{1} \times \vec{b}_{2}=\left|\begin{array}{lll}\hat{i} & \hat{j} & \hat{k} \\ 1 & -2 & 2 \\ 3 & -2 & -2\end{array}\right|=(4+4) \hat{i}-(-2-6) \hat{j}+(-2+6) \hat{k}=8 \hat{i}+8 \hat{j}+4 \hat{k}$
$\therefore\left|\vec{b}_{1} \times \vec{b}_{2}\right|=\sqrt{(8)^{2}+(8)^{2}+(4)^{2}}=12$
$\left(\vec{b}_{1} \times \vec{b}_{2}\right) \cdot\left(\vec{a}_{2}-\vec{a}_{1}\right)=(8 \hat{i}+8 \hat{j}+4 \hat{k}) \cdot(-10 \hat{i}-2 \hat{j}-3 \hat{k})=-80-16-12=-108$
Substituting all the values in equation (1), we obtain
$d=\left|\frac{-108}{12}\right|=9$
Therefore, the shortest distance between the two given lines is 9 units.

## Question 10:

Find the coordinates of the point where the line through $(5,1,6)$ and $(3,4,1)$ crosses the YZ-plane

## Answer

It is known that the equation of the line passing through the points, $\left(x_{1}, y_{1}, z_{1}\right)$ and $\left(x_{2}\right.$,
$\left.y_{2}, z_{2}\right)$, is $\frac{x-x_{1}}{x_{2}-x_{1}}=\frac{y-y_{1}}{y_{2}-y_{1}}=\frac{z-z_{1}}{z_{2}-z_{1}}$
The line passing through the points, $(5,1,6)$ and $(3,4,1)$, is given by,
$\frac{x-5}{3-5}=\frac{y-1}{4-1}=\frac{z-6}{1-6}$
$\Rightarrow \frac{x-5}{-2}=\frac{y-1}{3}=\frac{z-6}{-5}=k$ (say)
$\Rightarrow x=5-2 k, y=3 k+1, z=6-5 k$
Any point on the line is of the form ( $5-2 k, 3 k+1,6-5 k$ ).
The equation of YZ-plane is $x=0$
Since the line passes through YZ-plane,
$5-2 k=0$
$\Rightarrow k=\frac{5}{2}$
$\Rightarrow 3 k+1=3 \times \frac{5}{2}+1=\frac{17}{2}$
$6-5 k=6-5 \times \frac{5}{2}=\frac{-13}{2}$

Therefore, the required point is $\left(0, \frac{17}{2}, \frac{-13}{2}\right)$.

## Question 11:

Find the coordinates of the point where the line through $(5,1,6)$ and $(3,4,1)$ crosses the $Z X$ - plane.

Answer
It is known that the equation of the line passing through the points, $\left(x_{1}, y_{1}, z_{1}\right)$ and $\left(x_{2}\right.$,
$\left.y_{2}, z_{2}\right)$, is $\frac{x-x_{1}}{x_{2}-x_{1}}=\frac{y-y_{1}}{y_{2}-y_{1}}=\frac{z-z_{1}}{z_{2}-z_{1}}$
The line passing through the points, $(5,1,6)$ and $(3,4,1)$, is given by,
$\frac{x-5}{3-5}=\frac{y-1}{4-1}=\frac{z-6}{1-6}$
$\Rightarrow \frac{x-5}{-2}=\frac{y-1}{3}=\frac{z-6}{-5}=k($ say $)$
$\Rightarrow x=5-2 k, y=3 k+1, z=6-5 k$
Any point on the line is of the form ( $5-2 k, 3 k+1,6-5 k$ ).
Since the line passes through ZX-plane,
$3 k+1=0$
$\Rightarrow k=-\frac{1}{3}$
$\Rightarrow 5-2 k=5-2\left(-\frac{1}{3}\right)=\frac{17}{3}$
$6-5 \mathrm{k}=6-5\left(-\frac{1}{3}\right)=\frac{23}{3}$

Therefore, the required point is $\left(\frac{17}{3}, 0, \frac{23}{3}\right)$.

## Question 12:

Find the coordinates of the point where the line through $(3,-4,-5)$ and $(2,-3,1)$ crosses the plane $2 x+y+z=7$ ).
Answer
It is known that the equation of the line through the points, $\left(x_{1}, y_{1}, z_{1}\right)$ and $\left(x_{2}, y_{2}, z_{2}\right)$, is
$\frac{x-x_{1}}{x_{2}-x_{1}}=\frac{y-y_{1}}{y_{2}-y_{1}}=\frac{z-z_{1}}{z_{2}-z_{1}}$
Since the line passes through the points, $(3,-4,-5)$ and $(2,-3,1)$, its equation is given by,
$\frac{x-3}{2-3}=\frac{y+4}{-3+4}=\frac{z+5}{1+5}$
$\Rightarrow \frac{x-3}{-1}=\frac{y+4}{1}=\frac{z+5}{6}=k($ say $)$
$\Rightarrow x=3-k, y=k-4, z=6 k-5$
Therefore, any point on the line is of the form ( $3-k, k-4,6 k-5$ ).
This point lies on the plane, $2 x+y+z=7$
$\therefore 2(3-k)+(k-4)+(6 k-5)=7$
$\Rightarrow 5 k-3=7$
$\Rightarrow k=2$
Hence, the coordinates of the required point are ( $3-2,2-4,6 \times 2-5$ ) i.e., (1, -2, 7).

## Question 13:

Find the equation of the plane passing through the point $(-1,3,2)$ and perpendicular to each of the planes $x+2 y+3 z=5$ and $3 x+3 y+z=0$.

Answer
The equation of the plane passing through the point $(-1,3,2)$ is
$a(x+1)+b(y-3)+c(z-2)=0$
where, $a, b, c$ are the direction ratios of normal to the plane.

It is known that two planes, $a_{1} x+b_{1} y+c_{1} z+d_{1}=0$ and $a_{2} x+b_{2} y+c_{2} z+d_{2}=0$, are
perpendicular, if $a_{1} a_{2}+b_{1} b_{2}+c_{1} c_{2}=0$
Plane (1) is perpendicular to the plane, $x+2 y+3 z=5$
$\therefore a \cdot 1+b \cdot 2+c \cdot 3=0$
$\Rightarrow a+2 b+3 c=0$
Also, plane (1) is perpendicular to the plane, $3 x+3 y+z=0$
$\therefore a \cdot 3+b \cdot 3+c \cdot 1=0$
$\Rightarrow 3 a+3 b+c=0$
From equations (2) and (3), we obtain
$\frac{a}{2 \times 1-3 \times 3}=\frac{b}{3 \times 3-1 \times 1}=\frac{c}{1 \times 3-2 \times 3}$
$\Rightarrow \frac{a}{-7}=\frac{b}{8}=\frac{c}{-3}=k$ (say)
$\Rightarrow a=-7 k, b=8 k, c=-3 k$
Substituting the values of $a, b$, and $c$ in equation (1), we obtain
$-7 k(x+1)+8 k(y-3)-3 k(z-2)=0$
$\Rightarrow(-7 x-7)+(8 y-24)-3 z+6=0$
$\Rightarrow-7 x+8 y-3 z-25=0$
$\Rightarrow 7 x-8 y+3 z+25=0$
This is the required equation of the plane.

## Question 14:

If the points $(1,1, p)$ and $(-3,0,1)$ be equidistant from the plane
$\vec{r} \cdot(3 \hat{i}+4 \hat{j}-12 \hat{k})+13=0$, then find the value of $p$.
Answer
The position vector through the point $(1,1, p)$ is $\vec{a}_{1}=\hat{i}+\hat{j}+p \hat{k}$
Similarly, the position vector through the point $(-3,0,1)$ is
$\vec{a}_{2}=-4 \hat{i}+\hat{k}$

The equation of the given plane is $\vec{r} \cdot(3 \hat{i}+4 \hat{j}-12 \hat{k})+13=0$
It is known that the perpendicular distance between a point whose position vector is
$\vec{a}$ and the plane, $\vec{r} \cdot \vec{N}=d$, is given by, $D=\frac{|\vec{a} \cdot \vec{N}-d|}{|\vec{N}|}$
Here, $\vec{N}=3 \hat{i}+4 \hat{j}-12 \hat{k}$ and $d=-13$
Therefore, the distance between the point $(1,1, p)$ and the given plane is
$D_{1}=\frac{|(\hat{i}+\hat{j}+p \hat{k}) \cdot(3 \hat{i}+4 \hat{j}-12 \hat{k})+13|}{|3 \hat{i}+4 \hat{j}-12 \hat{k}|}$
$\Rightarrow D_{1}=\frac{|3+4-12 p+13|}{\sqrt{3^{2}+4^{2}+(-12)^{2}}}$
$\Rightarrow D_{1}=\frac{|20-12 p|}{13}$
Similarly, the distance between the point $(-3,0,1)$ and the given plane is
$D_{2}=\frac{|(-3 \hat{i}+\hat{k}) \cdot(3 \hat{i}+4 \hat{j}-12 \hat{k})+13|}{|3 \hat{i}+4 \hat{j}-12 \hat{k}|}$
$\Rightarrow D_{2}=\frac{|-9-12+13|}{\sqrt{3^{2}+4^{2}+(-12)^{2}}}$
$\Rightarrow D_{2}=\frac{8}{13}$
It is given that the distance between the required plane and the points, $(1,1, p)$ and $(-3,0,1)$, is equal.
$\therefore D_{1}=D_{2}$
$\Rightarrow \frac{|20-12 p|}{13}=\frac{8}{13}$
$\Rightarrow 20-12 p=8$ or $-(20-12 p)=8$
$\Rightarrow 12 p=12$ or $12 p=28$
$\Rightarrow p=1$ or $p=\frac{7}{3}$

## Question 15:

Find the equation of the plane passing through the line of intersection of the planes
$\vec{r} \cdot(\hat{i}+\hat{j}+\hat{k})=1$ and $\vec{r} \cdot(2 \hat{i}+3 \hat{j}-\hat{k})+4=0$ and parallel to $x$-axis.
Answer
The given planes are
$\vec{r} \cdot(\hat{i}+\hat{j}+\hat{k})=1$
$\Rightarrow \vec{r} \cdot(\hat{i}+\hat{j}+\hat{k})-1=0$
$\vec{r} \cdot(2 \hat{i}+3 \hat{j}-\hat{k})+4=0$
The equation of any plane passing through the line of intersection of these planes is
$[\vec{r} \cdot(\hat{i}+\hat{j}+\hat{k})-1]+\lambda[\vec{r} \cdot(2 \hat{i}+3 \hat{j}-\hat{k})+4]=0$
$\vec{r} \cdot[(2 \lambda+1) \hat{i}+(3 \lambda+1) \hat{j}+(1-\lambda) \hat{k}]+(4 \lambda+1)=0$
Its direction ratios are $(2 \lambda+1)$, $(3 \lambda+1)$, and $(1-\lambda)$.
The required plane is parallel to $x$-axis. Therefore, its normal is perpendicular to $x$-axis.
The direction ratios of $x$-axis are 1,0 , and 0 .
$\therefore 1 .(2 \lambda+1)+0(3 \lambda+1)+0(1-\lambda)=0$
$\Rightarrow 2 \lambda+1=0$
$\Rightarrow \lambda=-\frac{1}{2}$

Substituting $\lambda=-\frac{1}{2}$ in equation (1), we obtain
$\Rightarrow \vec{r} \cdot\left[-\frac{1}{2} \hat{j}+\frac{3}{2} \hat{k}\right]+(-3)=0$
$\Rightarrow \vec{r}(\hat{j}-3 \hat{k})+6=0$

Therefore, its Cartesian equation is $y-3 z+6=0$
This is the equation of the required plane.

## Question 16:

If $O$ be the origin and the coordinates of $P$ be $(1,2,-3)$, then find the equation of the plane passing through P and perpendicular to OP .

Answer
The coordinates of the points, $O$ and $P$, are $(0,0,0)$ and $(1,2,-3)$ respectively.
Therefore, the direction ratios of OP are $(1-0)=1,(2-0)=2$, and $(-3-0)=-3$ It is known that the equation of the plane passing through the point $\left(x_{1}, y_{1} z_{1}\right)$ is
$a\left(x-x_{1}\right)+b\left(y-y_{1}\right)+c\left(z-z_{1}\right)=0$ where, $\mathrm{a}, b$, and $c$ are the direction ratios of normal.
Here, the direction ratios of normal are 1,2 , and -3 and the point $P$ is $(1,2,-3)$.
Thus, the equation of the required plane is
$1(x-1)+2(y-2)-3(z+3)=0$
$\Rightarrow x+2 y-3 z-14=0$

## Question 17:

Find the equation of the plane which contains the line of intersection of the planes
$\vec{r} \cdot(\hat{i}+2 \hat{j}+3 \hat{k})-4=0, \vec{r} \cdot(2 \hat{i}+\hat{j}-\hat{k})+5=0$ and which is perpendicular to the plane
$\vec{r} \cdot(5 \hat{i}+3 \hat{j}-6 \hat{k})+8=0$.
Answer
The equations of the given planes are
$\vec{r} \cdot(\hat{i}+2 \hat{j}+3 \hat{k})-4=0$
$\vec{r} \cdot(2 \hat{i}+\hat{j}-\hat{k})+5=0$
The equation of the plane passing through the line intersection of the plane given in equation (1) and equation (2) is
$[\vec{r} \cdot(\hat{i}+2 \hat{j}+3 \hat{k})-4]+\lambda[\vec{r} \cdot(2 \hat{i}+\hat{j}-\hat{k})+5]=0$
$\vec{r} \cdot[(2 \lambda+1) \hat{i}+(\lambda+2) \hat{j}+(3-\lambda) \hat{k}]+(5 \lambda-4)=0$

The plane in equation (3) is perpendicular to the plane, $\vec{r} \cdot(5 \hat{i}+3 \hat{j}-6 \hat{k})+8=0$
$\therefore 5(2 \lambda+1)+3(\lambda+2)-6(3-\lambda)=0$
$\Rightarrow 19 \lambda-7=0$
$\Rightarrow \lambda=\frac{7}{19}$

Substituting $\lambda=\frac{7}{19}$ in equation (3), we obtain
$\Rightarrow \vec{r} \cdot\left[\frac{33}{19} \hat{i}+\frac{45}{19} \hat{j}+\frac{50}{19} \hat{k}\right] \frac{-41}{19}=0$
$\Rightarrow \vec{r} \cdot(33 \hat{i}+45 \hat{j}+50 \hat{k})-41=0$
This is the vector equation of the required plane.
The Cartesian equation of this plane can be obtained by substituting $\vec{r}=x \hat{i}+y \hat{j}+z \hat{k}$ in equation (3).
$(x \hat{i}+y \hat{j}+z \hat{k}) \cdot(33 \hat{i}+45 \hat{j}+50 \hat{k})-41=0$
$\Rightarrow 33 x+45 y+50 z-41=0$

## Question 18:

Find the distance of the point $(-1,-5,-10)$ from the point of intersection of the line
$\vec{r}=2 \hat{i}-\hat{j}+2 \hat{k}+\lambda(3 \hat{i}+4 \hat{j}+2 \hat{k})$ and the plane $\vec{r} \cdot(\hat{i}-\hat{j}+\hat{k})=5$.

## Answer

The equation of the given line is

$$
\begin{equation*}
\vec{r} \cdot=2 \hat{i}-\hat{j}+2 \hat{k}+\lambda(3 \hat{i}+4 \hat{j}+2 \hat{k}) \tag{1}
\end{equation*}
$$

The equation of the given plane is
$\vec{r} \cdot(\hat{i}-\hat{j}+\hat{k})=5$
Substituting the value of $\vec{r}$ from equation (1) in equation (2), we obtain
$[2 \hat{i}-\hat{j}+2 \hat{k}+\lambda(3 \hat{i}+4 \hat{j}+2 \hat{k})] \cdot(\hat{i}-\hat{j}+\hat{k})=5$
$\Rightarrow[(3 \lambda+2) \hat{i}+(4 \lambda-1) \hat{j}+(2 \lambda+2) \hat{k}] \cdot(\hat{i}-\hat{j}+\hat{k})=5$
$\Rightarrow(3 \lambda+2)-(4 \lambda-1)+(2 \lambda+2)=5$
$\Rightarrow \lambda=0$
Substituting this value in equation (1), we obtain the equation of the line as
$\vec{r}=2 \hat{i}-\hat{j}+2 \hat{k}$
This means that the position vector of the point of intersection of the line and the plane
is $\vec{r}=2 \hat{i}-\hat{j}+2 \hat{k}$
This shows that the point of intersection of the given line and plane is given by the coordinates, $(2,-1,2)$. The point is $(-1,-5,-10)$.
The distance $d$ between the points, $(2,-1,2)$ and $(-1,-5,-10)$, is
$d=\sqrt{(-1-2)^{2}+(-5+1)^{2}+(-10-2)^{2}}=\sqrt{9+16+144}=\sqrt{169}=13$

## Question 19:

Find the vector equation of the line passing through $(1,2,3)$ and parallel to the planes
$\vec{r}=(\hat{i}-\hat{j}+2 \hat{k})=5$ and $\vec{r} \cdot(3 \hat{i}+\hat{j}+\hat{k})=6$
Answer
Let the required line be parallel to vector $\vec{b}$ given by,
$\vec{b}=b_{1} \hat{i}+b_{2} \hat{j}+b_{3} \hat{k}$
The position vector of the point $(1,2,3)$ is $\vec{a}=\hat{i}+2 \hat{j}+3 \hat{k}$
The equation of line passing through $(1,2,3)$ and parallel to $\vec{b}$ is given by,
$\vec{r}=\vec{a}+\lambda \vec{b}$
$\Rightarrow \vec{r}(\hat{i}+2 \hat{j}+3 \hat{k})+\lambda\left(b_{1} \hat{i}+b_{2} \hat{j}+b_{3} \hat{k}\right)$
The equations of the given planes are
$\vec{r} \cdot(\hat{i}-\hat{j}+2 \hat{k})=5$
$\vec{r} \cdot(3 \hat{i}+\hat{j}+\hat{k})=6$
The line in equation (1) and plane in equation (2) are parallel. Therefore, the normal to the plane of equation (2) and the given line are perpendicular.
$\Rightarrow(\hat{i}-\hat{j}+2 \hat{k}) \cdot \lambda\left(b_{1} \hat{i}+b_{2} \hat{j}+b_{3} \hat{k}\right)=0$
$\Rightarrow \lambda\left(b_{1}-b_{2}+2 b_{3}\right)=0$
$\Rightarrow b_{1}-b_{2}+2 b_{3}=0$
Similarly, $(3 \hat{i}+\hat{j}+\hat{k}) \cdot \lambda\left(b_{1} \hat{i}+b_{2} \hat{j}+b_{3} \hat{k}\right)=0$
$\Rightarrow \lambda\left(3 b_{1}+b_{2}+b_{3}\right)=0$
$\Rightarrow 3 b_{1}+b_{2}+b_{3}=0$
From equations (4) and (5), we obtain
$\frac{b_{1}}{(-1) \times 1-1 \times 2}=\frac{b_{2}}{2 \times 3-1 \times 1}=\frac{b_{3}}{1 \times 1-3(-1)}$
$\Rightarrow \frac{b_{1}}{-3}=\frac{b_{2}}{5}=\frac{b_{3}}{4}$
Therefore, the direction ratios of $\vec{b}$ are $-3,5$, and 4 .
$\therefore \vec{b}=b_{1} \hat{i}+b_{2} \hat{j}+b_{3} \hat{k}=-3 \hat{i}+5 \hat{j}+4 \hat{k}$
Substituting the value of $\vec{b}$ in equation (1), we obtain
$\vec{r}=(\hat{i}+2 \hat{j}+3 \hat{k})+\lambda(-3 \hat{i}+5 \hat{j}+4 \hat{k})$
This is the equation of the required line.

## Question 20:

Find the vector equation of the line passing through the point $(1,2,-4)$ and
perpendicular to the two lines: $\frac{x-8}{3}=\frac{y+19}{-16}=\frac{z-10}{7}$ and $\frac{x-15}{3}=\frac{y-29}{8}=\frac{z-5}{-5}$
Answer
Let the required line be parallel to the vector $\vec{b}$ given by, $\vec{b}=b_{1} \hat{i}+b_{2} \hat{j}+b_{3} \hat{k}$

The position vector of the point $(1,2,-4)$ is $\vec{a}=\hat{i}+2 \hat{j}-4 \hat{k}$
The equation of the line passing through $(1,2,-4)$ and parallel to vector $\vec{b}$ is

$$
\begin{align*}
& \vec{r}=\vec{a}+\lambda \vec{b} \\
& \Rightarrow \vec{r}(\hat{i}+2 \hat{j}-4 \hat{k})+\lambda\left(b_{1} \hat{i}+b_{2} \hat{j}+b_{3} \hat{k}\right) \tag{1}
\end{align*}
$$

The equations of the lines are
$\frac{x-8}{3}=\frac{y+19}{-16}=\frac{z-10}{7}$
$\frac{x-15}{3}=\frac{y-29}{8}=\frac{z-5}{-5}$
Line (1) and line (2) are perpendicular to each other.
$\therefore 3 b_{1}-16 b_{2}+7 b_{3}=0$
Also, line (1) and line (3) are perpendicular to each other.

$$
\begin{equation*}
\therefore 3 b_{1}+8 b_{2}-5 b_{3}=0 \tag{5}
\end{equation*}
$$

From equations (4) and (5), we obtain

$$
\frac{b_{1}}{(-16)(-5)-8 \times 7}=\frac{b_{2}}{7 \times 3-3(-5)}=\frac{b_{3}}{3 \times 8-3(-16)}
$$

$$
\Rightarrow \frac{b_{1}}{24}=\frac{b_{2}}{36}=\frac{b_{3}}{72}
$$

$$
\Rightarrow \frac{b_{1}}{2}=\frac{b_{2}}{3}=\frac{b_{3}}{6}
$$

$\therefore$ Direction ratios of $\vec{b}$ are 2,3 , and 6 .

$$
\therefore \vec{b}=2 \hat{i}+3 \hat{j}+6 \hat{k}
$$

Substituting $\vec{b}=2 \hat{i}+3 \hat{j}+6 \hat{k}$ in equation (1), we obtain

$$
\vec{r}=(\hat{i}+2 \hat{j}-4 \hat{k})+\lambda(2 \hat{i}+3 \hat{j}+6 \hat{k})
$$

This is the equation of the required line.

## Question 21:

Prove that if a plane has the intercepts $a, b, c$ and is at a distance of $P$ units from the
origin, then $\frac{1}{a^{2}}+\frac{1}{b^{2}}+\frac{1}{c^{2}}=\frac{1}{p^{2}}$
Answer
The equation of a plane having intercepts $a, b, c$ with $x, y$, and $z$ axes respectively is given by,
$\frac{x}{a}+\frac{y}{b}+\frac{z}{c}=1$
The distance $(p)$ of the plane from the origin is given by,
$p=\left|\frac{\frac{0}{a}+\frac{0}{b}+\frac{0}{c}-1}{\sqrt{\left(\frac{1}{a}\right)^{2}+\left(\frac{1}{b}\right)^{2}+\left(\frac{1}{c}\right)^{2}}}\right|$
$\Rightarrow p=\frac{1}{\sqrt{\frac{1}{a^{2}}+\frac{1}{b^{2}}+\frac{1}{c^{2}}}}$
$\Rightarrow p^{2}=\frac{1}{\frac{1}{a^{2}}+\frac{1}{b^{2}}+\frac{1}{c^{2}}}$
$\Rightarrow \frac{1}{p^{2}}=\frac{1}{a^{2}}+\frac{1}{b^{2}}+\frac{1}{c^{2}}$

## Question 22:

Distance between the two planes: $2 x+3 y+4 z=4$ and $4 x+6 y+8 z=12$ is
(A)2 units (B)4 units (C)8 units
(D) $\frac{2}{\sqrt{29}}$ units

## Answer

The equations of the planes are
$2 x+3 y+4 z=4$
$4 x+6 y+8 z=12$
$\Rightarrow 2 x+3 y+4 z=6$
It can be seen that the given planes are parallel.
It is known that the distance between two parallel planes, $a x+b y+c z=d_{1}$ and $a x+b y$ $+c z=d_{2}$, is given by,
$D=\left|\frac{d_{2}-d_{1}}{\sqrt{a^{2}+b^{2}+c^{2}}}\right|$
$\Rightarrow D=\left|\frac{6-4}{\sqrt{(2)^{2}+(3)^{2}+(4)^{2}}}\right|$
$D=\frac{2}{\sqrt{29}}$

Thus, the distance between the lines is $\frac{2}{\sqrt{29}}$ units.
Hence, the correct answer is D.

## Question 23:

The planes: $2 x-y+4 z=5$ and $5 x-2.5 y+10 z=6$ are
(A) Perpendicular (B) Parallel (C) intersect $y$-axis
(C) passes through $\left(0,0, \frac{5}{4}\right)$

Answer
The equations of the planes are
$2 x-y+4 z=5 \ldots$ (1)
$5 x-2.5 y+10 z=6 \ldots$ (2)
It can be seen that,
$\frac{a_{1}}{a_{2}}=\frac{2}{5}$
$\frac{b_{1}}{b_{2}}=\frac{-1}{-2.5}=\frac{2}{5}$
$\frac{c_{1}}{c_{2}}=\frac{4}{10}=\frac{2}{5}$
$\therefore \frac{a_{1}}{a_{2}}=\frac{b_{1}}{b_{2}}=\frac{c_{1}}{c_{2}}$

Therefore, the given planes are parallel. Hence, the correct answer is $B$.
