CHAPTER-9 AREAS OF PARALLELOGRAMS AND TRIANGLES

Exercise-9.2

Q.1. In the given figure, PQRS is a parallelogram, $PE \perp SR$ and $RF \perp PS$. If $PQ = 16$ cm, $PE = 8$ cm & $RF = 10$ cm. Calculate AD.

Solution:

$$\begin{aligned} \text{Area of the parallelogram } PQRS &= PQ \times RS = RS \times PE && \text{---(1)} \\ &= 16 \times 8 \text{ cm}^2 \text{ (because } PQ = RS, PQRS \text{ is a parallelogram)} \\ &= 128 \text{ cm}^2 \end{aligned}$$

$$\begin{aligned} \text{Now, area of parallelogram PQRS} &= PS \times RF && \text{---(2)} \\ &= PS \times 10 \text{ cm}^2 \end{aligned}$$

From equation (1) and (2), we get

$$\begin{aligned} PS \times 10 &= 128 \\ \Rightarrow PS &= \frac{128}{10} \\ \Rightarrow PS &= 12.8 \text{ cm} \end{aligned}$$

Q.2. If E, F, G and H are the mid-points respectively, of the sides of a parallelogram ABCD show that $\text{Area}(EFGH) = \frac{1}{2} \text{Area}(ABCD)$

Solution:

Lets join HF.

In the parallelogram, i.e ABCD, $AD = BC$ and $AD \parallel BC$ (because in a parallelogram the opposite sides are equal and parallel)

$$AB = CD \text{ (opposite sides are equal)}$$

$$\Rightarrow \frac{1}{2}AD = \frac{1}{2}BC$$

And $\overline{AH} \parallel \overline{BF}$

$\Rightarrow AH = BF$ and $AH \parallel BF$ (because The mid point of AD and BC are H and F)

therefore ABFH is a parallelogram.

Since $\triangle HEF$ and parallelogram ABFH are between the same parallel lines AB and HF, and are on the same base HF.

therefore $\text{Area}(\triangle HEF) = \frac{1}{2} \text{Area}(ABFH) \dots (1)$

Similarly, we can prove that,

$$\text{Area}(\triangle HGF) = \frac{1}{2} \text{Area}(HDFC) \dots (2)$$

Add Equation (1) and Equation (2), we obtain

$$\text{Area}(\triangle HEF) + \text{Area}(\triangle HGF) = \frac{1}{2} \text{Area}(ABFH) + \frac{1}{2} \text{Area}(HDCF)$$

$$= \frac{1}{2} [\text{Area}(ABFH) + \text{Area}(HDCF)]$$

$$\Rightarrow \text{Area}(EFGH) = \frac{1}{2} (ABCD)$$

Q.3. DC and AD are two sides on which P and Q are two points lying respectively of a parallelogram ABCD. Prove that $\text{area}(APB) = \text{area}(BQC)$

Solution:

It is observed that, $\triangle BQC$ and parallelogram ABCD are between the same parallel lines AD and BC and lie on the same base BC.

$$\text{therefore } \text{Area}(\triangle BQC) = \frac{1}{2} \text{Area}(ABCD) \dots (1)$$

Similarly, we can say that $\triangle APB$ and parallelogram ABCD lie between the same lines AB and DC that are parallel and on the same base AB.

$$\text{therefore } \text{Area}(\triangle APB) = \frac{1}{2} \text{Area}(ABCD) \dots (2)$$

Equating both the equations, i.e. equation(1) and equation(2), we get

$$\text{Area}(\triangle BQC) = \text{Area}(\triangle APB)$$

Hence, proved.

Q.4. In the given figure, in the interior of a parallelogram ABCD, there exist a point P. Show that

$$(i) \text{area}(APB) + \text{area}(PCD) = \frac{1}{2} \text{area}(ABCD)$$

$$(ii) \text{area}(APD) + \text{area}(PBC) = \text{area}(APB) + \text{area}(PCD)$$

[Hint: Draw a line i.e. parallel to AB, through P]

Solution:

A line segment EF is drawn, parallel to line segment AB and passing through point P.

In the parallelogram ABCD,

$AB \parallel EF \dots (1)$ (as ABCD is a parallelogram)

therefore $AD \parallel BC$ (opposite sides of a parallelogram)

$\Rightarrow AE \parallel BF \dots (2)$

By equating, Equation (1) and Equation (2), we get,

$AB \parallel EF$ and $AE \parallel BF$

Therefore, quad ABFE is a parallelogram.

Misplaced & *therefore* $Area(\triangle APB) = \frac{1}{2} Area(ABFE) \dots (3)$

Similarly, for $\triangle PCD$ and parallelogram EFCD,

$Area(\triangle PCD) = \frac{1}{2} Area(EFCD) \dots (4)$

Add equation (3) and equation (4), we get,

$Area(\triangle APB) + Area(\triangle PCD) = \frac{1}{2} [Area(ABFE) + Area(EFCD)]$

$Area(\triangle APB) + Area(\triangle PCD) = \frac{1}{2} Area(ABCD) \dots (5)$

(ii)

A line segment MN is drawn, parallel to line segment AD and passing through point P.

In the parallelogram ABCD,

$MN \parallel AD$... (6) (as ABCD is a parallelogram)

therefore $AB \parallel DC$ (opposite sides of a parallelogram)

$\Rightarrow AM \parallel DN$... (7)

By equating, Equation (6) and Equation (7), we get,

$MN \parallel AD$ and $AM \parallel DN$

Therefore, quad AMND is a parallelogram.

It can be said that $\triangle APD$ and parallelogram AMND are between the same parallel lines AD and MN and lying on the same base AD.

therefore $\text{Area}(\triangle APD) = \frac{1}{2} \text{Area}(AMND)$... (8)

Similarly, for $\triangle PCB$ and parallelogram MNCB,

$\text{Area}(\triangle PCB) = \frac{1}{2} \text{Area}(MNCB)$... (9)

Add equation (8) and equation (9), we get,

$\text{Area}(\triangle APD) + \text{Area}(\triangle PCB) = \frac{1}{2} [\text{Area}(AMND) + \text{Area}(MNCB)]$

$\text{Area}(\triangle APD) + \text{Area}(\triangle PCB) = \frac{1}{2} \text{Area}(ABCD)$... (10)

Now compare equation (5) with equation (10), we get

$\text{Area}(\triangle APD) + \text{Area}(\triangle PBC) = \text{Area}(\triangle APB) + \text{Area}(\triangle PCD)$

Q.5. In the figure given below X is a point on the side BR and ABRS and PQRS are parallelograms. Prove that

(i) $\text{area}(PQRS) = \text{area}(ABRS)$

(ii) $\text{area}(\triangle PXS) = \frac{1}{2} \text{area}(PQRS)$

Solution:

(i) It can be said that parallelogram PQRS and the parallelogram ABRS lie in between the same parallel lines SR and PB and also, on the same base SR.

therefore $\text{Area}(PQRS) = \text{Area}(ABRS)$... (1)

$$\therefore \text{Area}(\triangle QRS) = \text{Area}(\triangle DRS) \dots (1)$$

(ii) Consider $\triangle AXS$ and parallelogram $ABRS$.

As these lie on the same base and are between the same parallel lines AS and BR ,

$$\therefore \frac{1}{2} \text{Area}(\triangle AXS) = \text{Area}(\triangle BRS) \dots (2)$$

By equating, equation (1) and equation (2), we get

$$\text{Area}(\triangle AXS) = \frac{1}{2} \text{Area}(PQRS)$$

Q.6. A farmer had a field and that was in a parallelogram shape $PQRS$. He took a point A on RS and he joined it to points P and Q . In how many parts the field is divided? What are the shapes of these parts? The farmer wants to sow wheat and pulses in equal portions of the field separately. How should he do it?

Solution:

From the figure, it can be observed that point A divides the field into three parts.

The parts which are triangular in shape are – $\triangle PSA$, $\triangle PAQ$, and $\triangle QRA$

$$\text{Area of } \triangle PSA + \text{Area of } \triangle PAQ + \text{Area of } \triangle QRA = \text{Area of parallelogram } PQRS \dots (i)$$

We know that if a parallelogram and a triangle are between the same parallels and on the same base, then the area of the triangle becomes half the area of the parallelogram.

$$\therefore \text{Area}(\triangle PAQ) = \frac{1}{2} \text{Area}(PQRS) \dots (ii)$$

By equation, equation (i) and (ii), we get

$$\text{Area}(\triangle PSA) + \text{Area}(\triangle QRA) = \frac{1}{2} \text{Area}(PQRS) \dots (iii)$$

Clearly, it can be said that the farmer should sow wheat in triangular part PAQ and he should sow pulses in other two triangular parts PSA and QRA or wheat in triangular parts PSA and QRA and in triangular part PAQ he should sow pulses.

Exercise – 9.3

Q.1. In the given figure, E is any point on median AD of a $\triangle ABC$. Prove that

$$\text{Area}(\triangle ABE) = \text{Area}(\triangle ACE)$$

Solution:

Given: AD is the median of $\triangle ABC$.

To Prove: $Area(\triangle ABC) = Area(\triangle ACE)$

Proof: In $\triangle ABC$,

AD is a median.

$$therefore Area(\triangle ABD) = Area(\triangle ACD) \dots (i)$$

In $\triangle EBC$,

ED is a median.

$$therefore Area(\triangle EBD) = Area(\triangle ECD) \dots (ii)$$

Subtracting equation (ii) from equation (i), we get

$$\begin{aligned} Area(\triangle ABD) - Area(\triangle EBD) &= Area(\triangle ACD) - Area(\triangle ECD) \\ \Rightarrow Area(\triangle ABE) &= Area(\triangle ACE) \end{aligned}$$

Q.2. In a $\triangle ABC$, E is the mid-point of median AD. Prove that

Misplaced & .

Solution:

Given: E is the mid-point of median AD in $\triangle ABC$.

To Prove: $Area(\triangle BED) = \frac{1}{4} Area(\triangle ABC)$

Proof: In $\triangle ABC$,

AD is a median.

$$therefore Area(\triangle ABD) = \frac{1}{2} Area(\triangle ABC) \dots (i) \text{ (because median of a triangle divides it into two triangles of equal area.)}$$

In $\triangle ABD$,

BE is a median.

$$therefore Area(\triangle BED) = Area(\triangle BEA) = \frac{1}{2} Area(\triangle ABD)$$

$$\begin{aligned} Area(\triangle BED) &= \frac{1}{2} Area(\triangle ABD) = \frac{1}{2} \cdot \frac{1}{2} Area(\triangle ABC) \text{ (From (i))} \\ Area(\triangle BED) &= \frac{1}{4} Area(\triangle ABC) \end{aligned}$$

Q.3. Show that the diagonals of a parallelogram divide it into four triangles of equal area.

Solution:

We know that diagonals of parallelogram bisect each other.

therefore O is the mid-point of AC and BD.

BO is the median in $\triangle ABC$. Therefore, it will divide it into two triangles of equal areas.

therefore $Area(\triangle AOB) = Area(\triangle BOC) \dots(i)$

In $\triangle BCD$, CO is the median.

therefore $Area(\triangle BOC) = Area(\triangle COD) \dots(ii)$

Similarly, $Area(\triangle COD) = Area(\triangle AOD) \dots(iii)$

By Equating equation(i), (ii) and (iii), we get

$$Area(\triangle AOB) = Area(\triangle BOC) = Area(\triangle COD) = Area(\triangle AOD)$$

Therefore, it is evident that the diagonals of a parallelogram divide it into four triangles of equal area.

Q.4. In figure, $\triangle ABC$ and $\triangle ABD$ are two triangles on the same base AB. If line segment CD is bisected by AB at O, show that $Area(\triangle ABC) = Area(\triangle ABD)$.

Solution:

Given: $\triangle ABC$ and $\triangle DBC$ are on the same base AB. Line segment CD is bisected by AB at O.

To Prove: $Area(\triangle ABC) = Area(\triangle ABD)$

Proof: Line-segment CD is bisected by AB at O.

Misplaced & AO is the median of $\triangle ACD$.

$$Area(\triangle ACO) = Area(\triangle ADO)$$

BO is the median of $\triangle BCD$.

BO is the median of $\triangle BCD$.

$$\therefore \text{Area}(\triangle BCO) = \text{Area}(\triangle BDO) \dots (ii)$$

Adding (i) and (ii), we get

$$\begin{aligned} \text{Area}(\triangle ACO) + \text{Area}(\triangle BCO) &= \text{Area}(\triangle ADO) + \text{Area}(\triangle BDO) \\ \Rightarrow \text{Area}(\triangle ABC) &= \text{Area}(\triangle ABD) \end{aligned}$$

Q.5. D, E and F are respectively the mid-points of the sides BC, CA and AB of a $\triangle ABC$.

Prove that

(i) BDEF is a parallelogram

$$(ii) \text{Area}(\triangle DEF) = \frac{1}{4} \text{Area}(\triangle ABC)$$

$$(iii) \text{Area}(BDEF) = \frac{1}{2} \text{Area}(\triangle ABC)$$

Solution:

Given: D, E and F are respectively the mid-points of the sides BC, CA and AB of a $\triangle ABC$.

To Prove: (i) BDEF is a parallelogram

$$(ii) \text{Area}(\triangle DEF) = \frac{1}{4} \text{Area}(\triangle ABC)$$

$$(iii) \text{Area}(BDEF) = \frac{1}{2} \text{Area}(\triangle ABC)$$

Proof: In $\triangle ABC$,

F is the mid-point of side AB and E is the mid-point of side AC.

$\therefore EF \parallel BC$ | In a triangle, the line segment joining the mid-points of any two sides is parallel to the 3rd side.

$$\Rightarrow EF \parallel BD \dots (1)$$

$$\text{Similarly, } EF \parallel BD \dots (2)$$

From (1) and (2), we can say that,

BDEF is a parallelogram.

(ii) As in (i), we can prove that

AFCE and AFDE are parallelograms.

FD is diagonal of the parallelogram BDEF.

$$\therefore \text{Area}(\triangle FBD) = \text{Area}(\triangle DEF) \dots (3)$$

$$\text{Similarly, } \text{Area}(\triangle DEF) = \text{Area}(\triangle FAE) \dots (4)$$

$$\text{Area}(\triangle DEF) = \text{Area}(\triangle DCE) \dots (5)$$

From equation (3), (4) and (5), we have

$$\text{Area}(\triangle FBD) = \text{Area}(\triangle DEF) = \text{Area}(\triangle FAE) = \text{Area}(\triangle DCE) \dots (6)$$

therefore ΔABC is divided into four non-overlapping triangles $\Delta FBD, \Delta DEF, \Delta FAE$ and ΔDCE

therefore $Area(\Delta ABC) = Area(\Delta FBD) + Area(\Delta DEF) + Area(\Delta FAE) + Area(\Delta DCE)$

$$= 4Area(\Delta DEF) \quad (\text{From equation(6)})$$

$$\Rightarrow Area(\Delta DEF) = \frac{1}{4}Area(\Delta ABC) \dots\dots(7)$$

$$(iii) Area(BDEF) = Area(\Delta FBD) + Area(\Delta DEF) \quad (\text{From equation(3)})$$

$$= Area(\Delta DEF) + Area(\Delta DEF)$$

$$= 2Area(\Delta DEF)$$

$$= 2 \cdot \frac{1}{4}Area(\Delta ABC) \quad (\text{From equation(7)})$$

$$= \frac{1}{2}Area(\Delta ABC)$$

Q.6. In the given figure, diagonals AC and BD of a quadrilateral $ABCD$ intersect at O such that $OB = OD$. If $AB = CD$, then show that:

$$(i) Area(\Delta DOC) = Area(\Delta AOB)$$

$$(ii) Area(\Delta DCB) = Area(\Delta ACB)$$

$$(iii) DA \parallel CB \text{ or } ABCD \text{ is a parallelogram.}$$

[Hint: From D and B , draw perpendiculars to AC]

Solution:

Given: Diagonals AC and BD of quadrilateral $ABCD$ intersect at O such that $OB = OD$.

To Prove: If $AB = CD$, then

$$(i) Area(\Delta DOC) = Area(\Delta AOB)$$

$$(ii) Area(\Delta DCB) = Area(\Delta ACB)$$

$$(iii) DA \parallel CB \text{ or } ABCD \text{ is a parallelogram.}$$

Construction: Draw $DE \perp AC$ and $BF \perp AC$.

Proof: In $\triangle DON$ and $\triangle BOM$,

$\angle DNO = \angle BMO$ (By Construction)

$\angle DON = \angle BOM$ (vertically opposite angles)

$OD = OB$ (Given)

By AAS congruence rule,

$\triangle DON \cong \triangle BOM$

$DN = BM$ (1)

We know that congruent triangles have equal areas.

$Area(\triangle DON) = Area(\triangle BOM)$ (2)

In $\triangle DNC$ and $\triangle BMA$,

$\angle DNC = \angle BMA$ (By Construction)

$CD = AB$ (Given)

$DN = BM$ [using equation(1)]

$\triangle DNC \cong \triangle BMA$ (RHS congruence rule)

$Area(\triangle DNC) = Area(\triangle BMA)$ (3)

Add equation(2) and (3) , we get

$Area(\triangle DON) + Area(\triangle DNC) = Area(\triangle BOM) + Area(\triangle BMA)$ therefore $Area(\triangle DOC) = Area(\triangle AOB)$

(ii) We got ,

$Area(\triangle DOC) = Area(\triangle AOB)$

Now, add $Area(\triangle OCB)$ on both the sides.

$\Rightarrow Area(\triangle DOC) + Area(\triangle OCB) = Area(\triangle AOB) + Area(\triangle OCB) \Rightarrow Area(\triangle DCB) = Area(\triangle ACB)$

(iii) We got ,

$Area(\triangle DCB) = Area(\triangle ACB)$

If two triangles have the same base and equal areas , then these will lie between the same parallels.

$DA \parallel CB$ (4)

In quadrilateral ABCD , one pair of opposite sides is equal ($AB = CD$) and the other pair of opposite sides is parallel ($DA \parallel CB$).

therefore ABCD is a parallelogram.

Q.7. D and E are points on sides AB and AC respectively of $\triangle ABC$ such that $Area(\triangle DBC) = Area(\triangle EBC)$ Prove that $DE \parallel BC$.

Solution:

Given : D and E are points on sides AB and AC respectively of $\triangle ABC$ such that $Area(\triangle DBC) = Area(\triangle EBC)$.

To Prove: $DE \parallel BC$

Proof: As $(\triangle DBC)$ and $(\triangle EBC)$ have equal area and are on the same base.

therefore $(\triangle DBC)$ and $(\triangle EBC)$ will lie between the same parallel lines.

therefore $DE \parallel BC$

Q.8. *XY is a line parallel to side BC of a triangle ABC. If $BE \parallel AC$ and $CF \parallel AB$ meet XY at E and E respectively , show that $Area(\triangle ABE) = Area(\triangle ACF)$*

Solution:

Given: XY is a line parallel to side BC of a triangle ABC. If $BE \parallel AC$ and $CF \parallel AB$ meet XY at E and E respectively.

To Prove: $Area(\triangle ABE) = Area(\triangle ACF)$

Proof: $XY \parallel BC$ (given)

And $CF \parallel BX$ (because $CF \parallel AB$ (given))

therefore BCFX is a parallelogram.

$BC = XF$

$BC = XY + YF \dots (1)$

Again ,

$XY \parallel BC$ (because $BE \parallel AC$)

And $BE \parallel CY$

therefore BCYE is a parallelogram

therefore $BC = YE$ (because opposite sides of a parallelogram are equal)

$\Rightarrow BC = XY + XE \dots (2)$

From (1) and (2) ,

$XY + YF = XY + XE$

$\Rightarrow YF = XE$

$\Rightarrow XF = YF$

therefore $\triangle AXE$ and $\triangle AYE$ have equal bases ($XE=YF$) on the same line EF and have common vertex A.

therefore Their altitudes are also the same.

therefore $\text{Area}(\triangle AXE) = \text{Area}(\triangle AYE) \dots\dots(4)$

therefore $\triangle BXE$ and $\triangle BFE$ have equal bases ($XE=YF$) on the same line EF and are between the same parallels EF and BC ($XY \parallel BC$).

therefore $\text{Area}(\triangle BXE) = \text{Area}(\triangle BFE)$ (because Two triangles on the same base (or equal bases) and between the same parallels are equal in area)

Add the corresponding sides of (4) and (5), we get

$$\begin{aligned} \text{Area}(\triangle AXE) + \text{Area}(\triangle BXE) &= \text{Area}(\triangle AYE) + \text{Area}(\triangle BFE) \\ \Rightarrow \text{Area}(\triangle ABE) &= \text{Area}(\triangle ACF) \end{aligned}$$

Q.9. The side AB of a parallelogram ABCD is produced to any point P. A line through A and parallel to CP meets CB produced at Q and then parallelogram PBQR is completed (see the following figure). Show that $\text{Area}(\text{Parallelogram } ABCD) = \text{Area}(\text{Parallelogram } PBQR)$.

[Hint: Join AC and PQ. Now compare $\text{Area}(\triangle ACQ)$ and $\text{Area}(\triangle APQ)$]

Solution:

Given: The side AB of a parallelogram ABCD is produced to any point P. A line through A and parallel to CP meets CB produced at Q and then parallelogram PBQR is completed.

To Prove: $\text{Area}(\text{Parallelogram } ABCD) = \text{Area}(\text{Parallelogram } PBQR)$.

Construction: Join AC and PQ.

Proof: AC is a diagonal of parallelogram ABCD

therefore $\text{Area}(\triangle ABC) = \frac{1}{2} \text{Area}(\text{parallelogram } ABCD) \dots\dots\dots(1)$

PQ is a diagonal of parallelogram BQRP

$$\therefore \text{Area}(\triangle BPQ) = \frac{1}{2} \text{Area}(\text{parallelogram } BQRP) \dots\dots\dots (2)$$

$\triangle ACQ$ and $\triangle APQ$ are on the same base AQ and between the same parallels AQ and CP.

$$\therefore \text{Area}(\triangle ACQ) = \text{Area}(\triangle APQ)$$

Now, subtract $\text{Area}(\triangle ABQ)$ from both the sides.

$$\Rightarrow \text{Area}(\triangle ACQ) - \text{Area}(\triangle ABQ) = \text{Area}(\triangle APQ) - \text{Area}(\triangle ABQ)$$

$$\Rightarrow \text{Area}(\triangle ABC) = \text{Area}(\triangle BPQ)$$

$$\Rightarrow \frac{1}{2} \text{Area}(\text{parallelogram } ABCD) = \frac{1}{2} \text{Area}(\text{parallelogram } PBQR)$$

$$\Rightarrow \text{Area}(\text{parallelogram } ABCD) = \text{Area}(\text{parallelogram } PBQR) \quad [\text{From (1) and (2)}]$$

Q.10. Diagonals AC and BD of a trapezium ABCD with $AB \parallel DC$ intersect each other at O. Prove that $\text{Area}(\triangle AOD) = \text{Area}(\triangle BOC)$.

Solution:

Given: Diagonals AC and BD of a trapezium ABCD with $AB \parallel DC$ intersect each other at O.

To Prove: $\text{Area}(\triangle AOD) = \text{Area}(\triangle BOC)$.

Proof: $\triangle ABD$ and $\triangle ABC$ are on the same base AB and between the same parallels AB and DC.

$$\therefore \text{Area}(\triangle ABD) = \text{Area}(\triangle ABC)$$

Now, subtract $\text{Area}(\triangle AOB)$ from both the sides;

$$\Rightarrow \text{Area}(\triangle ABD) - \text{Area}(\triangle AOB) = \text{Area}(\triangle ABC) - \text{Area}(\triangle AOB)$$

$$\Rightarrow \text{Area}(\triangle AOD) = \text{Area}(\triangle BOC)$$

Q.11. In the given figure, ABCDE is a pentagon. A line through B parallel to AC meets DC produced at F. Show that

$$(i) \text{Area}(\triangle ACB) = \text{Area}(\triangle ACF)$$

$$(ii) \text{Area}(AEDF) = \text{Area}(ABCDE)$$

Solution:

Given: ABCDE is a pentagon. A line through B parallel to AC meets DC produced at F.

To Prove: (i) $\text{Area}(\triangle ACB) = \text{Area}(\triangle ACF)$

$$(ii) \text{Area}(AEDF) = \text{Area}(ABCDE)$$

Proof:

(i) $\triangle ACB$ and $\triangle ACF$ lie on the same base AC and are between the same parallels AC and BF.

$$\text{Area}(\triangle ACB) = \text{Area}(\triangle ACF)$$

(ii) because $\text{Area}(\triangle ACB) = \text{Area}(\triangle ACF)$

Add $\text{Area}(\triangle EDC)$ on both the sides, we get

$$\Rightarrow \text{Area}(\triangle ACB) + \text{Area}(\triangle EDC) = \text{Area}(\triangle ACF) + \text{Area}(\triangle EDC)$$

$$\Rightarrow \text{Area}(\triangle ABCDE) = \text{Area}(\triangle AEDF)$$

$$\Rightarrow \text{Area}(\triangle AEDF) = \text{Area}(\triangle ABCDE)$$

Q.12. A villager Ram has a plot of land in the shape of a quadrilateral. The Gram Panchayat of the village decided to take over some portion of his plot from one of the corners to construct a Health Centre. Ram agrees to the above proposal with the condition that he should be given an equal amount of land in lieu of his land adjoining his plot so as to form a triangular plot. Explain how this proposal will be implemented.

Solution:

Let ABCD be the plot of land in the shape of a quadrilateral.

Let the portion ADE be taken over by the Gram Panchayat of the village from one corner D to construct a Health Centre.

Join AC. Draw a line through D parallel to AC to meet BC produced in P.

Then Ram must given the land ECP adjoining his plot so as to form a triangular plot ABP as then.

Proof: $\triangle DAP$ and $\triangle DCP$ are between the same parallels DP and AC.

therefore $\text{Area}(\triangle DAP) = \text{Area}(\triangle DCP)$ (Two triangles on the same base (or equal bases) and between the same parallels are equal in area)

Subtract $\text{Area}(\triangle DEP)$ from both the sides.

$$\Rightarrow \text{Area}(\triangle DAP) - \text{Area}(\triangle DEP) = \text{Area}(\triangle DCP) - \text{Area}(\triangle DEP) \quad \text{Area}(\triangle ADE) = \text{Area}(\triangle PCE)$$

Now, add $\text{Area}(\triangle BCE)$ on the both the sides.

$$\text{Area}(\triangle ADE) = \text{Area}(\triangle PCE)$$

$$\Rightarrow \text{Area}(ABCD) = \text{Area}(\triangle ABP)$$

$$\Rightarrow \text{Area}(\triangle ADE) + \text{Area}(\triangle BCE) = \text{Area}(\triangle PCE) + \text{Area}(\triangle BCE)$$

Q.13. *ABCD is a trapezium with $AB \parallel DC$. A line parallel to AC intersects AB at X and BC at Y. Prove that $\text{Area}(\triangle ADX) = \text{Area}(\triangle ACY)$. [Hint: Join CX.]*

Solution:

Given: ABCD is a trapezium with $AB \parallel DC$. A line parallel to AC intersects AB at X and BC at Y.

To Prove: $\text{Area}(\triangle ADX) = \text{Area}(\triangle ACY)$.

Construction: Join CX

Proof: $\triangle ADX$ and $\triangle ACX$ are on the same base AX and between the same parallels AB and DC.

$$\therefore \text{Area}(\triangle ADX) = \text{Area}(\triangle ACX) \dots\dots(1)$$

$\triangle ACX$ and $\triangle ACY$ are on the same base AC and between the same parallels AC and XY.

$$\therefore \text{Area}(\triangle ACX) = \text{Area}(\triangle ACY) \dots\dots(2)$$

From equation(1) and (2) , we get

$$\text{Area}(\triangle ADX) = \text{Area}(\triangle ACY)$$

Q.14. *In the given figure, $AP \parallel BQ \parallel CR$. Prove that $\text{Area}(\triangle AQC) = \text{Area}(\triangle PBR)$.*

Solution: $AP \parallel BQ \parallel CR$

To Prove: $\text{Area}(\triangle AQC) = \text{Area}(\triangle PBR)$.

Proof: $\triangle BAQ$ and $\triangle BQR$ are between the same parallels BQ and AP and on the same base BQ.

$$\text{Area}(\triangle BCQ) = \text{Area}(\triangle BPQ) \dots\dots(1)$$

$\triangle BCQ$ and $\triangle BQR$ are between the same parallels BQ and CR and on the same base BQ.

$$\text{Area}(\triangle BCO) = \text{Area}(\triangle BOR) \dots\dots(2)$$

Now , add equation(1) and (2) , we get

$$\begin{aligned} \text{Area}(\triangle BAQ) + \text{Area}(\triangle BCQ) &= \text{Area}(\triangle BPQ) + \text{Area}(\triangle BQR) \\ \Rightarrow \text{Area}(\triangle AQC) &= \text{Area}(\triangle PBR) \end{aligned}$$

Q.15. Diagonals AC and BD of a quadrilateral ABCD intersect at O in such a way that $\text{Area}(\triangle AOD) = \text{Area}(\triangle BOC)$. Prove that ABCD is a trapezium.

Solution:

Given: Diagonals AC and BD of a quadrilateral ABCD intersect at O in such a way that $\text{Area}(\triangle AOD) = \text{Area}(\triangle BOC)$.

To Prove: ABCD is a trapezium.

Proof: $\text{Area}(\triangle AOD) = \text{Area}(\triangle BOC)$

Now , add $\text{Area}(\triangle AOB)$ on both the sides.

$$\begin{aligned} \text{Area}(\triangle AOD) + \text{Area}(\triangle AOB) &= \text{Area}(\triangle BOC) + \text{Area}(\triangle AOB) \\ \Rightarrow \text{Area}(\triangle ABD) &= \text{Area}(\triangle ABC) \end{aligned}$$

But $\triangle ABD$ and $\triangle ABC$ are on the same base AB.

therefore $\triangle ABD$ and $\triangle ABC$ will have equal corresponding altitudes

and therefore $\triangle ABD$ and $\triangle ABC$ will lie between the same parallels

$$\Rightarrow AB \parallel DC$$

therefore ABCD is a trapezium. (because A quadrilateral is a trapezium if exactly one pair of opposite sides is parallel)

Q.16. In the given figure , $\text{Area}(\triangle DRC) = \text{Area}(\triangle DPC)$ and $\text{Area}(\triangle BDP) = \text{Area}(\triangle ARC)$. Show that both the quadrilaterals ABCD and DCPR are trapeziums.

Solution:

Given: $Area(\triangle DRC) = Area(\triangle DPC)$ and $Area(\triangle BDP) = Area(\triangle ARC)$

To Prove: both the quadrilaterals ABCD and DCPR are trapeziums.

Proof: $Area(\triangle DRC) = Area(\triangle DPC)$ (given)(1)

But $\triangle DRC$ and $\triangle DPC$ are on the same base DC.

therefore $\triangle DRC$ and $\triangle DPC$ will have equal corresponding altitudes.

And *therefore* $\triangle DRC$ and $\triangle DPC$ will lie between the same parallels.

therefore $DC \parallel RP$ (because a quadrilateral is a trapezium if exactly one pair of opposite sides is parallel.)

therefore DCPR is a trapezium.

Again , $Area(\triangle BDP) = Area(\triangle ARC)$ (using(1))

$$\Rightarrow Area(\triangle BDC) + Area(\triangle DPC) = Area(\triangle ADC) + Area(\triangle DRC)$$

$$\Rightarrow Area(\triangle BDC) = Area(\triangle ADC)$$

But $\triangle BDC$ and $\triangle ADC$ are on the same base DC.

therefore $\triangle BDC$ and $\triangle ADC$ will have equal corresponding altitudes.

And $\triangle BDC$ and $\triangle ADC$ will lie between the same parallels.

therefore $AB \parallel DC$

$\Rightarrow ABCD$ is a trapezium. (because a quadrilateral is trapezium if exactly one pair of opposite sides is parallel.)

Q.17. From the following figures, find out which figures lie between the same parallels and same base. If the case is found, then write the common base and two parallels.

Solution:

(I) The figures (quadrilateral APCD and quadrilateral ABCD), and (quadrilateral PBCD and quadrilateral ABCD), lie between the same parallels DC and AB and lie on the same base DC.

(II) The figures ($\triangle TRQ$ and parallelogram SRQP), (quads TPQR and parallelogram SRQP), (quad STQR and SRQP), lie on the same base RQ and between the same parallels RQ and SP.

(III) Quads APCD and ABQD lie on the same base AD, and between the same parallels AD and BQ.
