

Study Material Downloaded from Vedantu

About **Vedantu**

Vedantu is India's largest **LIVE online teaching platform** with best teachers from across the country.

Vedantu offers Live Interactive Classes for **JEE**, **NEET**, KVPY, NTSE, Olympiads, **CBSE**, **ICSE**, IGCSE, IB & State Boards for Students Studying in **6-12th Grades** and Droppers.

Awesome Master Teachers

Anand Prakash B.Tech, IIT Roorkee Co-Founder, Vedantu

Pulkit Jain B.Tech, IIT Roorkee Co-Founder, Vedantu

Vamsi Krishna B.Tech, IIT Bombay Co-Founder, Vedantu

My mentor is approachable and **guides me** in my future aspirations as well.

Student **- Ayushi**

My son loves the sessions and **I can** already see the change. Parent - Sreelatha

95% Students of Regular Tuitions on Vedantu scored above **90%** in exams!

Vedantii FREE MASTER CLASS SERIES

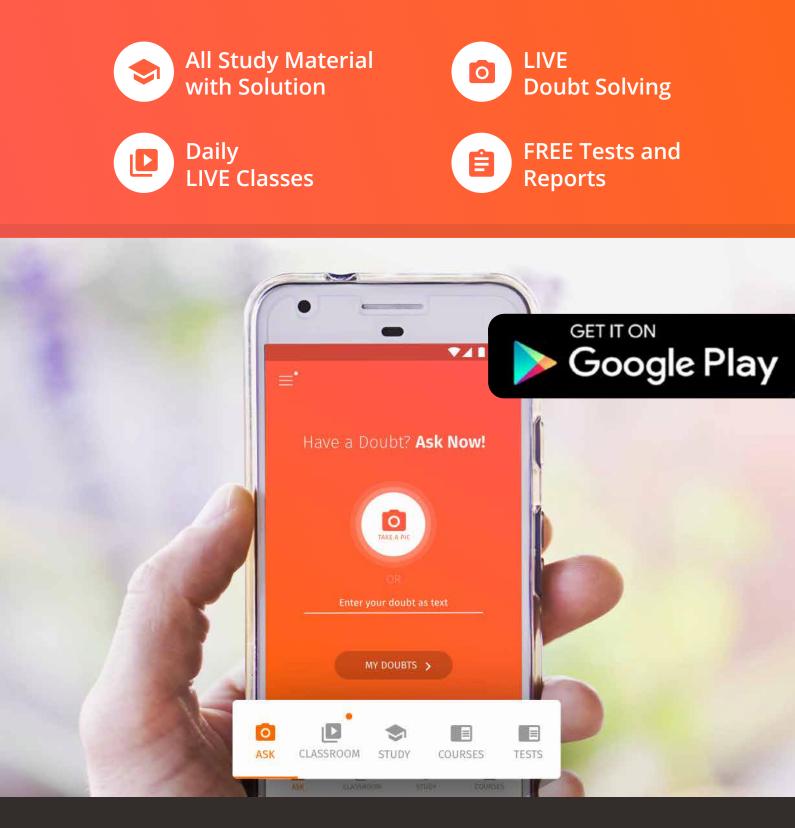

- For Grades 6-12th targeting JEE, CBSE, ICSE & much more
- Free 60 Minutes Live Interactive classes everyday
- Cearn from the Master Teachers India's best

Chapter 1 Physical World

Science and its origin

Science is a **systematic understanding of natural phenomena** in detail so that it can be **predicted, controlled and modified**. Science involves exploring, experimenting and speculating phenomena happening around us.

- The word **Science** is derived from a latin verb *Scientia* meaning 'to know'.
- Scientific method is a way to gain knowledge in a systematic and in-depth way. It involves:
 - Systematic observations
 - Controlled experiments
 - Qualitative and Quantitative reasoning
 - Mathematical modeling
 - Prediction and verification (or falsification) of theories
 - Speculation or Prediction
- Science does not have any final theory. The improved observations, accurate tools keep improving the knowledge and perspective. Johannes Kepler used Tycho Brahe's research on planetary motion to improve Nicolas Copernicus theory.
- Quantum mechanics was developed to deal with atomic and nuclear phenomena. Work of Ernest Rutherford on nuclear model of atom became basis of quantum theory given by Niels Bohr. Antiparticle theory of Paul Dirac led to the discovery of antielectron (positron) by Carl Anderson.

Natural Sciences

Natural science is a branch of science concerned with the description, prediction, and understanding of natural phenomena, based on observational and empirical evidence. It consists of following disciplines:

- Physics
- o Chemistry
- Biology

Physics

Physics is a study of basic laws of nature and their manifestation in different natural phenomena. Physics is the study of physical world and matter and its motion through space and time, along with related concepts such as energy and force.

- Word Physics is derived from a Greek word phusiké meaning nature.
- Two principal types of approaches in Physics are:
 - 1. **Unification**: This approach considers all of the world's phenomena as a collection of universal laws in different domains and conditions. Example, law of gravitation applies both to a falling apple from a tree as well as motion of planets around the sun. Electromagnetism laws govern all electric and magnetic phenomena.
 - 2. **Reduction**: This approach is to derive properties of complex systems from the properties and interaction of its constituent parts. Example, temperature studied under thermodynamics is also related to average kinetic energy of molecules in a system (kinetic theory).

Impact and uses of Physics:

- It can explain a phenomena happening over a large magnitude with a simple theory.
- Experiments and observations are used to develop new theories for unidentified phenomena and improve old theories for existing phenomena.
- Development of devices using laws of physics.

NCERT Solutions for Class 6 to 12 (Math & Science) Revision Notes for Class 6 to 12 (Math & Science) **RD Sharma Solutions for Class 6 to 12 Mathematics** RS Aggarwal Solutions for Class 6, 7 & 10 Mathematics Important Questions for Class 6 to 12 (Math & Science) CBSE Sample Papers for Class 9, 10 & 12 (Math & Science) Important Formula for Class 6 to 12 Math **CBSE Syllabus for Class 6 to 12** Lakhmir Singh Solutions for Class 9 & 10 **Previous Year Question Paper CBSE Class 12 Previous Year Question Paper CBSE Class 10 Previous Year Question Paper** JEE Main & Advanced Question Paper **NEET Previous Year Question Paper**

Scope of Physics

Scope of Physics is vast as it covers quantities with length magnitude as high as 10⁴⁰m or more (astronomical studies of universe) and as low as 10⁻¹⁴m or less (study of electrons, protons etc). Similarly the range of time scale goes from 10⁻²²s to 10¹⁸s and mass from 10⁻³⁰kg to 10⁵⁵kg.

Physics is broadly divided into two types based on its scope - **Classical Physics and Modern Physics**. Classical physics deal with the **macroscopic phenomena** while the modern physics deals with the **microscopic phenomena**.

Macroscopic Domain

Macroscopic domain includes phenomena at large scales like laboratory, terrestrial and astronomical. It includes following subjects:

- Mechanics It is based on Newton's laws on motion and the laws of gravitation. It is concerned with motion/equilibrium of particles, rigid and deformable bodies and general system of particles. Examples,
 - a. Propulsion of rocket by ejecting gases
 - b. Water/Sound waves
 - c. Equilibrium of bent rod under a load
- 2. Electrodynamics It deals with electric and magnetic phenomena associated with charged and magnetic bodies. Examples,
 - a. motion of a current-carrying conductor in a magnetic field
 - b. the response of a circuit to an ac voltage (signal)
 - c. the propagation of radio waves in the ionosphere
- 3. **Optics** It deals with phenomena involving light. Examples,
 - a. Reflection and refraction of light
 - b. Dispersion of light through a prism
 - c. Colour exhibited by thin films
- 4. **Thermodynamics** It deals with systems in macroscopic equilibrium and changes in internal energy, temperature, entropy etc. of systems under application of external force or heat. Examples,
 - a. Efficiency of heat engines
 - b. Direction of physical and chemical process

<u>Microscopic Domain</u>

Microscopic domain includes phenomena at minuscule scales like atomic, molecular and nuclear. It also deals with interaction of probes like electrons, photons and other elementary particles. Quantum theory has been developed to handle these phenomena.

Factors responsible for progress of Physics

- Quantitative analysis along with qualitative analysis.
- Application of universal laws in different contexts.
- Approximation approach (complex phenomena broken down into collection of basic laws).
- Extracting and focusing on essential features of a phenomenon.

Hypothesis, Axiom and Models

- a) **Hypothesis** is a supposition without assuming that it is true. It may not be proved but can be verified through a series of experiments.
- b) **Axiom** is a self-evident truth that it is accepted without controversy or question.
- c) Model is a theory proposed to explain observed phenomena.
- d) **Assumption** is the basis of physics, where a number of phenomena can be explained. These assumptions are made from experiments, observation and a lot of statistical data.

Technological applications of Physics

Several examples where Physics and its concepts have led to discoveries/inventions are listed below.

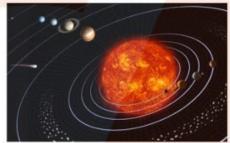

- Steam engine was developed from the industrial revolution in eighteenth century.
- Wireless communication was developed after discovery of laws of electricity and magnetism.
- Neuron-induced fission of uranium, done by Hahn and Meitner in 1938, led to the formation of nuclear power reactors and nuclear weapons.
- Conversion of solar, wind, geothermal etc. energy into electricity.

Fundamental Forces in nature

The forces which we see in our day to day life like muscular, friction, forces due to compression and elongation of springs and strings, fluid and gas pressure, electric, magnetic, interatomic and intermolecular forces are **derived forces** as their originations are due to a few fundamental forces in nature. A few fundamental forces are:

1. Gravitational Force: It is the force of mutual attraction between any two objects by virtue of their masses. It is a universal force as every object experiences this force due to every other object in the universe.

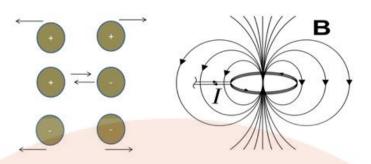

The gravitational force causes the apple to fall as well as planets to revolve around the sun.

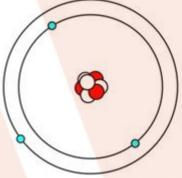

2. Electromagnetic Force: It is the force between charged particles. Charges at rest have electric attraction (between unlike charges) and repulsion (between like charges). Charges in motion produce magnetic force. Together they are called Electromagnetic Force.

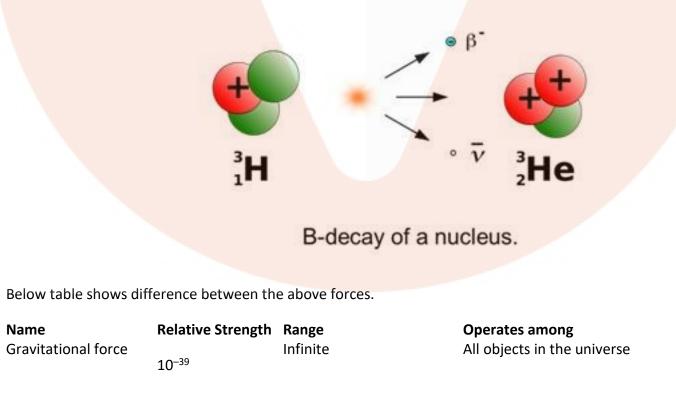

The unlike charges attract each other while like charges repel each other. A current carrying wire generates magnetic field around it, giving rise to electromagnetism.

3. Strong Nuclear Force: It is the attractive force between protons and neutrons in a nucleus. It is chargeindependent and acts equally between a proton and a proton, a neutron and a neutron, and a proton and a neutron. Recent discoveries show that protons and neutrons are built of elementary particles, quarks.

Bohr Model of Lithium Atom. Nucleus is a tightly bound entity with a strong force of attraction between protons and neutrons. Electrons revolve around the nucleus.

Weak Nuclear Force: This force appears only in certain nuclear processes such as the β-decay of a nucleus. In β-decay, the nucleus emits an electron and an uncharged particle called neutrino. This particle was first predicted by Wolfgang Pauli in 1931.

Como alamantan (nartiala)

		some elementary particles, particularly electron and
Weak nuclear force 10 ^{–13}	Very short <i>,</i> Sub-nuclearsi (-10 ⁻¹⁶ m)	ze neutrino
Electromagnetic force 10 ⁻²	Infinite	Charged particles
10		Nucleons, heavier
Strong nuclear force 1	Short, nuclear size (-10⁻ ¹⁵ m)	elementary particles

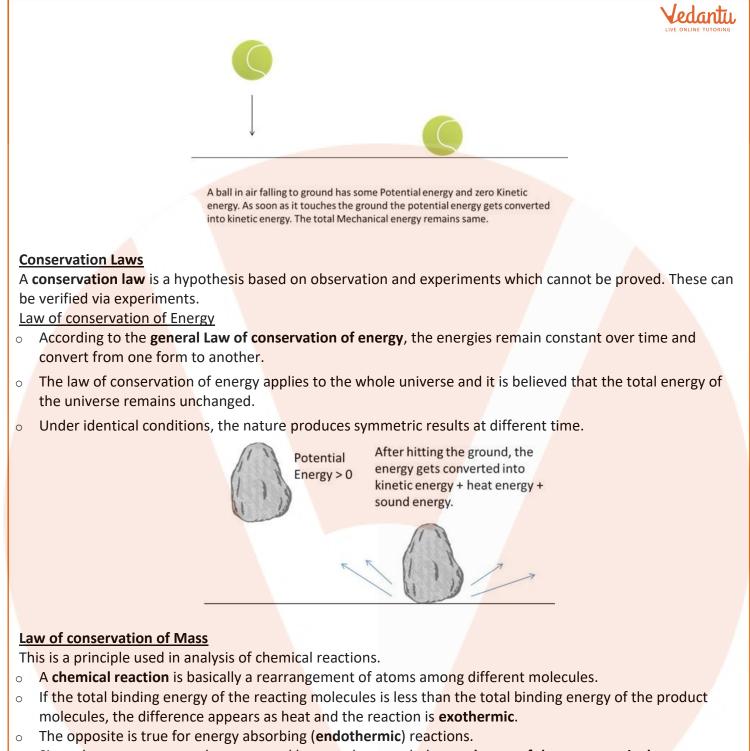

5. <u>Unification of Forces</u>: There have been physicists who have tried to combine a few of the above fundamental forces. These are listed in table below.

Name of Physicist	Year	Achievement in Unification
Isaac Newton	1687	Unified celestial and terrestrial mechanics.
Hans Christian Oerste and Michael Faraday		Unified electric and magnetic phenomena to give rise to electromagnetism.
James Clerk Maxwell	1873	Unified electricity, magnetism and optics to show that light is an electromagnetic wave.
Sheldon Glashow, Abdus Salam, Steven Weinberg	1979	Gave the idea of electro-weak force which is a combination of electromagnetic and weak nuclear force.
Carlo Rubia, Simon Vander Meer	1984	Verified the theory of elctro-weak force.

Conserved Quantities

Physics gives laws to summarize the investigations and observations of the phenomena occurring in the universe.

- Physical quantities that remain constant with time are called **conserved quantities**. Example, for a body under external force, the kinetic and potential energy change over time but the total mechanical energy (kinetic + potential) remains constant.
- Conserved quantities can be scalar (Energy) or vector (Total linear momentum and total angular momentum).

- Since the atoms are merely rearranged but not destroyed, the total mass of the reactants is the same as the total mass of the products in a chemical reaction.
- Mass is related to energy through Einstein theory,
- **E** = mc², where c is the speed of light in vacuum

Law of conservation of linear momentum

- Symmetry of laws of nature with respect to translation in space is termed as law of conservation of linear momentum.
- $_{\odot}$ Example law of gravitation is same on earth and moon even if the acceleration due to gravity at moon is 1/6th than that at earth.

Law of conservation of angular momentum

 Isotropy of space (no intrinsically preferred direction in space) underlies the law of conservation of angular momentum.
