## Answer All the Questions

1) If $A^{T} A^{-1}$ is symmetric, then $A^{2}=$
(a) $\mathrm{A}^{-1}$
(b) $\left(\mathrm{A}^{\mathrm{T}}\right)^{2}$
(c) $\mathrm{A}^{\mathrm{T}}$
(d) $\left(\mathrm{A}^{-1}\right)^{2}$
2) Let $A$ be a $3 \times 3$ matrix and $B$ its adjoint matrix If $|B|=64$, then $|A|=$
(a) $\pm 2$
(b) $\pm 4$
(c) $\pm 8$
(d) $\pm 12$
3) If $z=\frac{(\sqrt{3}+i)^{3}(3 i+4)^{2}}{(8+6 i)^{2}}$, then $|z|$ is equal to
(a) 0
(b) 1
(c) 2
(d) 3
4) The amplitude of $\frac{1}{i}$ is equal to
(a) 0
(b) $\frac{\pi}{2}$
(c) $-\frac{\pi}{2}$
(d) $\pi$
5) If $x^{3}+12 x^{2}+10 a x+1999$ definitely has a positive zero, if and only if
(a) $a \geq 0$
(b) $\mathrm{a}>0$
(c) $\mathrm{a}<0$
(d) $\mathrm{a} \leq 0$
6) If $x=\frac{1}{5}$, the valur of $\cos \left(\cos ^{-1} x+2 \sin ^{-1} x\right)$ is
(a) $-\sqrt{\frac{24}{25}}$
(b) $\sqrt{\frac{24}{25}}$
(c) $\frac{1}{5}$
(d) $-\frac{1}{5}$
7) The area of quadrilateral formed with foci of the hyperbolas $\frac{x^{2}}{a^{2}}-\frac{y^{2}}{b^{2}}=1$ and $\frac{x^{2}}{a^{2}}-\frac{y^{2}}{b^{2}}=-1$
(a) $4\left(a^{2}+b^{2}\right)$
(b) $2\left(\mathrm{a}^{2}+\mathrm{b}^{2}\right)$
(c) $\mathrm{a}^{2}+\mathrm{b}^{2}$
(d) $\frac{1}{2}\left(\mathrm{a}^{2}+\mathrm{b}^{2}\right)$
8) An ellipse hasOB as semi minor axes, F and $\mathrm{F}^{\prime}$ its foci and the angle $\mathrm{FBF}^{\prime}$ is a right angle. Then the eccentricity of the ellipse is
(a) $\frac{1}{\sqrt{2}}$
(b) $\frac{1}{2}$
(c) $\frac{1}{4}$
(d) $\frac{1}{\sqrt{3}}$
9) If $\vec{a}, \vec{b}, \vec{c}$ are three unit vectors such that $\vec{a}$ is perpendicular to $\vec{b}$ and is parallel to $\vec{c}$ then $\vec{a} \times(\vec{b} \times \vec{c})$ is equal to
(a) $\vec{a}$
(b) $\vec{b}$
(c) $\vec{c}$
(d) $\overrightarrow{0}$
10) Distance from the origin to the plane $3 x-6 y+2 z 7=0$ is
(a) 0
(b) 1
(c) 2
(d) 3
11) The slope of the line normal to the curve $\mathrm{f}(\mathrm{x})=2 \cos 4 \mathrm{x}$ at $x=\frac{\pi}{12}$
(a) $-4 \sqrt{3}$
(b) -4
(c) $\frac{\sqrt{3}}{12}$
(d) $4 \sqrt{3}$
12) The point of inflection of the curve $y=(x-1)^{3}$ is
(a) $(0,0)$
(b) $(0,1)$
(c) $(1,0)$
(d) $(1,1)$
13) The percentage error of fifth root of 31 is approximately how many times the percentage error in 31 ?
(a) $\frac{1}{31}$
(b) $\frac{1}{5}$
(c) 5
(d) 31
14) If $\int_{a}^{a} \frac{1}{4+x^{2}} d x=\frac{\pi}{8}$ then a is
(a) 4
(b) 1
(c) 3
(d) 2
15) The value of $\int_{-1}^{2}|x| d x$
(a) $\frac{1}{2}$
(b) $\frac{3}{2}$
(c) $\frac{5}{2}$
(d) $\frac{7}{2}$
16) The order and degree of the differential equation $\frac{d^{2} y}{d x^{2}}+\left(\frac{d y}{d x}\right)^{1 / 3}+x^{1 / 4}=0$ are respectively
(a) 2,3
(b) 3, 3
(c) 2,6
(d) 2, 4
17) The solution of $\frac{d y}{d x}+\mathrm{p}(\mathrm{x}) \mathrm{y}=0$ is
(a) $y=c e^{\int p d x}$
(b) $y=c e^{-\int p d x}$
(c) $x=c e^{-\int p d x}$
(d) $x c e^{\int p d x}$
18) If $X$ is a binomial randam variable with expected value 6 and variance 2.4 , then $P(X=5)$ is
(a) $\left(\frac{10}{5}\right)^{2}\left(\frac{3}{5}\right)^{6}\left(\frac{2}{5}\right)^{4}$
(b) $\left(\frac{10}{5}\right)\left(\frac{3}{5}\right)^{5}$
(c) $\left(\frac{10}{5}\right)\left(\frac{3}{5}\right)^{4}\left(\frac{2}{5}\right)^{6}$
(d) $\left(\frac{10}{5}\right)\left(\frac{3}{5}\right)^{5}\left(\frac{2}{5}\right)^{5}$
19) A computer salesperson knows from his past experience that he seUs computers to one in every twenty customers who enter the showroom. What is the probability that he will seU a computer to exactly two of the next three customers?
(a) $\frac{57}{20^{3}}$
(b) $\frac{57}{20^{2}}$
(c) $\frac{19^{3}}{20^{3}}$
(d) $\frac{57}{20}$
20) The dual of $\neg(p \vee q) \vee[p \vee(p \wedge \neg r)]$ is
(a) $\neg(\mathrm{p} \wedge \mathrm{q}) \wedge[\mathrm{p} \vee(\mathrm{p} \wedge \neg \mathrm{r})]$
(b) $(\mathrm{p} \wedge \mathrm{q}) \wedge[\mathrm{p} \wedge(\mathrm{p} \vee \neg \mathrm{r})]$
(c) $\neg(p \wedge q) \wedge[p \wedge(p \wedge r)]$
(d) $\neg(\mathrm{p} \wedge \mathrm{q}) \wedge[\mathrm{p} \wedge(\mathrm{p} \vee \neg \mathrm{r})]$

Note: i)Answer any 7 questions only ii)Question No. 30 compuls
21) If adj $A=\left[\begin{array}{ccc}-1 & 2 & 2 \\ 1 & 1 & 2 \\ 2 & 2 & 1\end{array}\right]$, find $\mathrm{A}^{-1}$.
22) Simplify the following i $i^{2} i^{3} \ldots i^{2000}$
23) Evaluate the following limit, if necessary use l'Hôpital Rule $\lim _{x \rightarrow \infty} e^{-x} \sqrt{x}$
24) Evaluate $\int_{0}^{1} x^{3}(1-x)^{4} d x$
${ }^{25)}$ The probability that a certain kind of component will survive a electrical test is $\frac{3}{4}$.
Find the probability that exactly 3 of the 5 components tested survive.
26) Establish the equivalence property $\mathrm{p} \rightarrow \mathrm{q} \equiv \neg \mathrm{p} v \mathrm{q}$
27) Find the value of $\tan ^{-1}(-1)+\cos ^{-1}\left(\frac{1}{2}\right)+\sin ^{-1}\left(-\frac{1}{2}\right)$
28) If $\vec{a}, \vec{b}, \vec{c}$ are three non-coplanar vectors represented by concurrent edges of a parallelepiped of volume 4 cubic units, find the value of $(\vec{a}+\vec{b}) \cdot(\vec{b} \times \vec{c})+(\vec{b}+\vec{c}) \cdot(\vec{c} \times \vec{a})+(\vec{c}+\vec{a})(\vec{a} \times \vec{b})$
29) The equation $y=\frac{1}{32} x^{2}$ models cross sections of parabolic mirrors that are used for solar energy. There is a heating tube located at the focus of each parabola; how high is this tube located above the vertex of the parabola?
30) Find the differential equation of the family of all non-vertical lines in a plane.
P.A.PALANIAPPAN,MSc.,MPhil.,BEd

31) Decrypt the received encoded message $\left[\begin{array}{ll}2 & -3\end{array}\right]\left[\begin{array}{cc}20 & 4\end{array}\right]$ with the encryption matrix $\left[\begin{array}{cc}-1 & -1 \\ 2 & 1\end{array}\right]$ and the decryption matrix as its inverse, where the system of codes are described by the numbers 1-26 to the letters A Z respectively, and the number 0 to a blank space.
32) Prove that a straight line and parabola cannot intersect at more than two points.
33) If the equation $3 x^{2}+(3-p) x y+q y^{2}-2 p x=8 p q$ represents a circle, find $p$ and $q$. Also determine the centre and radius of the circle
34) Suppose $f(x)$ is a differentiable function for all $x$ with $f^{\prime}(x) \leq 29$ and $f(2)=17$. What is the maximum value of $f(7)$ ?
35) The slope of the tangent to the curve at any point is the reciprocal of four times the ordinate at that point. The curve passes through ( 2,5 ). Find the equation of the curve.
36) A lottery with 600 tickets gives one prize of Rs.200, four prizes of noo, and six prizes of Rs. 50 . If the ticket costs is Rs.2, find the expected winning amount of a ticket
37) Find the square root of $6-8 i$.
38) If the straight lines $\frac{x-1}{2}=\frac{y+1}{\lambda}=\frac{z}{2}$ and $\frac{x-1}{2}=\frac{y+1}{\lambda}=\frac{z}{\lambda}$ are coplanar, find $\lambda$ and equations of the planes containing these two lines.
39) Evaluate $\int_{-\pi}^{\pi} \frac{\cos ^{2} x}{1+a^{x}} d x$
40) If $\mathrm{u}(\mathrm{x}, \mathrm{y}, \mathrm{z})=\mathrm{xy}^{2} \mathrm{z}^{3}, \mathrm{x}=\sin \mathrm{t}, \mathrm{y}=\cos \mathrm{t}, \mathrm{z}=1+\mathrm{e}^{2 \mathrm{t}}$, find $\frac{d u}{d t}$

## Answer All the Questions

41) a) A boy is walking along the path $y=a x^{2}+b x+c$ through the points $(-6,8),(-2,-12)$, and (3, 8). He wants to meet his friend at $P(7,60)$. Will he meet his friend? (Use Gaussian elimination method.)
(OR)
b) If $\mathrm{z}=\mathrm{x}+\mathrm{iy}$ is a complex number such that $\operatorname{Im}\left(\frac{2 z+1}{i z+1}\right)=0$ show that the locus of z is $2 \mathrm{x}^{2}+2 \mathrm{y}^{2}+\mathrm{x}-2 \mathrm{y}=0$
42) a) Solve $\cos \left(\sin ^{-1}\left(\frac{x}{\sqrt{1+x^{2}}}\right)\right)=\sin \left\{\cot ^{-1}\left(\frac{3}{4}\right)\right\}$

## (OR)

b) Solve: $8 x^{\frac{3}{2 x}}-8 x^{\frac{-3}{2 x}}=63$
43) a) Two coast guard stations are located 600 km apart at points $\mathrm{A}(0,0)$ and $\mathrm{B}(0,600)$. A distress signal from a ship at $P$ is received at slightly different times by two stations. It is determined that the ship is 200 km farther from station A than it is from station B. Determine the equation of hyperbola that passes through the location of the ship.

## (OR)

b) Find the equation of a straight line passing through the point of intersection of the straight lines
$\vec{r}=(\hat{i}+\hat{3 j}-\hat{k})+t(2 \hat{i}+3 \hat{j}+2 \hat{k}) \quad$ and $\frac{x-2}{1}=\frac{y-4}{2}=\frac{z+3}{4}$ and perpendicular to both straight lines.
44) a) Find the points on the unit circle $x^{2}+y^{2}=1$ nearest and farthest from $(1,1)$.

## (OR)

b) Let $\mathrm{w}(\mathrm{x}, \mathrm{y})=\mathrm{xy}+\frac{e^{y}}{y^{2}+1}$ for all $(\mathrm{x}, \mathrm{y}) \in \mathrm{R}^{2}$. Calculate $\frac{\partial^{2} w}{\partial y \partial x}$ and $\frac{\partial^{2} w}{\partial x \partial y}$
45) a) Father of a family wishes to divide his square field bounded by $x=0, x=4, y=4$ and $y=0$ along the curve $y^{2} x=4$ and $x^{2} y=4$ into three equal parts for his wife, daughter and son. Is it possible to divide? If so, find the area to be divided among them.
(OR)
b) $\left(x^{2}+y^{2}\right) d y=x y d x$. It is given that $y(1)=1$ and $y\left(x_{0}\right)=e$. Find the value of $x_{0}$.
46) a) A random variable X has the following probability mass function
$\left.\begin{array}{|l|l|l|l|l|l|}\hline \mathrm{x} & 1 & 2 & 3 & 4 & 5\end{array}\right)$

Find
(i) $\mathrm{P}(2<\mathrm{X}<6)$
(ii) $\mathrm{P}(2 \leq \mathrm{X}<5)$
(iii) $\mathrm{P}(\mathrm{X} \leq 4)$
(iv) $\mathrm{P}(3<\mathrm{X})$

## (OR)

b) a) Define an operation*on Q as follows: $\mathrm{a} * \mathrm{~b}=\left(\frac{a+b}{2}\right)$; $\mathrm{a}, \mathrm{b} \in \mathrm{Q}$. Examine the closure, commutative, and associative properties satisfied by*on Q .
b) Define an operation* on Q as follows: $\mathrm{a} * \mathrm{~b}=\left(\frac{a+b}{2}\right)$; $\mathrm{a}, \mathrm{b} \in \mathrm{Q}$. Examine the existence of identity and the existence of inverse for the operation * on Q .
47) a) Prove by vector method that the perpendiculars (attitudes) from the vertices to the opposite sides of a triangle are concurrent.
b) Sketch the curve $y=f(x)=x^{3}-6 x-9$

## PART-II

## PG ASST IN MATHS

## PATTUKKOTTAI

9443407917
Note: i)Answer any 7 questions only ii)Question No. 30 compuls
-
21) We compute $|\operatorname{adj} \mathrm{A}|=\left|\begin{array}{ccc}-1 & 2 & 2 \\ 1 & 1 & 2 \\ 2 & 2 & 1\end{array}\right|=9$.

So, we get ${ }_{-1}=\underset{\frac{1}{\sqrt{|\operatorname{adj} A|}}}{\operatorname{adj}(\mathrm{A})=} \frac{1}{\sqrt{9}}\left[\begin{array}{ccc}-1 & 2 & 2 \\ 1 & 1 & 2 \\ 2 & 2 & 1\end{array}\right]= \pm \frac{1}{3}\left[\begin{array}{ccc}-1 & 2 & 2 \\ 1 & 1 & 2 \\ 2 & 2 & 1\end{array}\right]$
22) $\mathrm{i}^{2} \mathrm{i}^{3} \ldots . . \mathrm{i}^{2000}$
$=i^{1+2+3+\ldots . .+2000}$
$=i^{\frac{2000 \times 2001}{2}}$
$\left[\therefore 1+2+3+\ldots . \mathrm{n}=\frac{n(n+1)}{2}\right]$
$=11000 \times 2001$
$=i^{2001000}$
$=1$
[ $\because 2001000$ is divisible by 4 as its last two digits are divisible by 4 ]
23) $\lim _{x \rightarrow \infty} e^{-x} \sqrt{x}=\lim _{x \rightarrow \infty} \frac{\sqrt{x}}{e^{x}}=\frac{\infty}{\infty}$

Which is in indeterminate form. Applying L' Hopital rule we get,
$\lim _{x \rightarrow \infty} \frac{\frac{1}{2} x^{\frac{1}{2}-1}}{e^{x}}=\frac{1}{2} \lim _{x \rightarrow \infty} \frac{x^{\frac{1}{2}-1}}{e^{x}}=\frac{1}{2} \lim _{x \rightarrow \infty} \frac{e^{-x}}{\sqrt{x}}$
$\frac{1}{2} \lim _{x \rightarrow \infty} e^{-x} \sqrt{\frac{1}{x}}=\frac{1}{2} e^{-\infty}(0)=0 \quad\left[\right.$ When $\mathrm{x} \rightarrow \infty, \frac{1}{x} \rightarrow 0 \mathrm{e}^{-\infty}=0$ ]
24) $\int_{0}^{1} x^{m}(1-x)^{n} d x=\frac{m!\times n!}{(m+n+1)!}$
$\therefore \int_{0}^{1} x^{3}(1-x)^{4} d x=\frac{3!\times 4!}{(3+4+1)!}=\frac{3!\times 4!}{8!}=\frac{3 \times 2 \times 1 \times 4 \times 3 \times 2 \times 1}{8 \times 7 \times 6 \times 5 \times 4 \times 3 \times 2 \times 1}=\frac{1}{280}$
25) Given $p=\frac{3}{4}$
$\mathrm{n}=5$
$\mathrm{P}(\mathrm{X}=\mathrm{x})=\mathrm{nC}_{\mathrm{x}} \mathrm{p}^{\mathrm{x}}(1-\mathrm{p})^{\mathrm{n}-\mathrm{x}}$
$P(X=3)=5 C_{3}\left(\frac{3}{4}\right)^{3}\left(1-\frac{3}{4}\right)^{2}$
$P(X=3)=5 C_{2}\left(\frac{3}{4}\right)^{3}\left(\frac{1}{4}\right)^{2}[\because \mathrm{nCr}=\mathrm{nC} \underset{\mathrm{n}-\mathrm{r}}{]}]$
$\mathrm{P}(\mathrm{X}=3)=\frac{5 \times A}{2 \times 1} \times \frac{3 \times 3 \times 3}{A \times 4 \times 4 \times 4 \times 4}$
$=\frac{135}{512}$
26) $\mathrm{pq} \neg \mathrm{pp} \rightarrow \mathrm{q} \neg \mathrm{p} \vee \mathrm{q}$

| T | TF | T |
| :--- | :--- | :--- |
| T | T | F |
| F | F |  |
| F T | T | T |
| FF T | T | T |

The entries in the columns corresponding to $\mathrm{p} \rightarrow \mathrm{q}$ and $\neg \mathrm{p} v \mathrm{q}$ are identical and hence they are equivalent.
27) Let $\tan ^{-1}(-1)=y$. Then, $\tan y=-1=-\tan \frac{\pi}{4}=\tan \left(-\frac{\pi}{4}\right)$

As $-\frac{\pi}{4} \in\left(-\frac{\pi}{2}, \frac{\pi}{2}\right), \tan ^{-} 1(-1)=-\frac{\pi}{3}$
Now, $\cos ^{-1}\left(\frac{1}{2}\right)=\mathrm{y}$ implies $\cos \mathrm{y}=\frac{1}{2}=\cos \frac{\pi}{3}$
As $\frac{\pi}{3} \in[0, \pi], \cos ^{-1}\left(\frac{1}{2}\right)=\frac{\pi}{3}$
Now, $\sin ^{-1}\left(-\frac{1}{2}\right)=y$ implies $\sin y=-\frac{1}{2}=\sin \left(-\frac{\pi}{3}\right)$.
As $-\frac{\pi}{6} \in\left[-\frac{\pi}{2}, \frac{\pi}{2}\right], \sin ^{-} 1\left(-\frac{1}{2}\right)=-\frac{\pi}{6}$
Therefore, $\tan ^{-1}(-1)+\cos ^{-1}\left(\frac{1}{2}\right)+\sin ^{-} 1\left(-\frac{1}{2}\right)=-\frac{\pi}{4}+\frac{\pi}{3}-\frac{\pi}{6}=-\frac{\pi}{12}$
28) Given $\vec{a}, \vec{b}, \vec{c}$ are concurrent edges of a parallelepiped, and its volume is 4 cubic units.
$\vec{a} .(\vec{b} \times \vec{c})= \pm 4 \quad$......(1)
Consider
$(\vec{a}+\vec{b}) \cdot(\vec{b} \times \vec{c})+(\vec{b}+\vec{c}) \cdot(\vec{c} \times \vec{a})+(\vec{c}+\vec{a})(\vec{a} \times \vec{b})$
$=\vec{a} \cdot(\vec{b} \times \vec{c})+\vec{b} \cdot(\vec{b} \times \vec{c})+\vec{b} \cdot(\vec{c} \times \vec{a})+\vec{c} \cdot(\vec{c} \times \vec{a})+\vec{c} \cdot(\vec{a} \times \vec{b})+\vec{a} \cdot(\vec{a} \times \vec{b})$
$=\vec{a} .(\vec{b} \times \vec{c})+0+\vec{b} \cdot(\vec{b} \times \vec{c})+0+\vec{b} \cdot(\vec{c} \times \vec{a})+0$
$[\because \vec{a} .(\vec{a} \times \vec{b})=0]$
$=\vec{a} .(\vec{b} \times \vec{c})+\vec{a} .(\vec{b} \times \vec{c})+\vec{a} .(\vec{b} \times \vec{c})$
$[\because[\vec{a} \vec{b} \vec{c}]=[\vec{a} \vec{b} \vec{c}]=[\vec{a} \vec{b} \vec{c}]]$
$=3[\vec{a} .(\vec{b} \times \vec{c})]=3( \pm 4)$ using (1)
$= \pm 12$
29) Equation of the parabola is $y=\frac{1}{32} x^{2}$

That is $x^{2}=32 \mathrm{y}$; the vertex is $(0,0)$
$=4(8) y$
$\Rightarrow a=8$
So the heating tube needs to be placed at focus $(0, \mathrm{a})$. Hence the heating tube needs to be placed 8 units above the vertex of the parabola.

30) Equation of the family of non-vertical lines in a plane is $a x+b y=1, b \neq 0$,
$a \in R$.
Differentiating with respect to 'x' we get,
$\mathrm{a}+\mathrm{b} \frac{d y}{d x}=0$
Differentiating again with respect to ' $x$ ' we get,
$b \frac{d^{2} y}{d x^{2}}=0 \Rightarrow \frac{d^{2} y}{d x^{2}}=0 \quad[\because b \neq 0]$
P.A.PALANIAPPAN,MSc.,MPhil.,BEd

PART-III
$7 \times 3=21$

## PG ASST IN MATHS

## PATTUKKOTTAI

## 9443407917

Note: i)Answer any 7 questions only ii)Question No. 40 compulsary
31) Let the encryption matrix be $\mathrm{A}=\left[\begin{array}{cc}-1 & -1 \\ 2 & 1\end{array}\right]$
$|\mathrm{A}|=-1+2=1 \neq 0$
$\therefore \mathrm{A}-1=\frac{1}{|A|} \operatorname{adj} A=\frac{1}{1}\left[\begin{array}{cc}1 & 1 \\ -2 & -1\end{array}\right]=\left[\begin{array}{cc}1 & 1 \\ -2 & -1\end{array}\right]$
Hence the decryption matrix is $\left[\begin{array}{cc}1 & 1 \\ -2 & -1\end{array}\right]$
Coded row matrix Decoding matrix Decoded row matrix

| [2-3] | $\left[\begin{array}{cc}1 & 1 \\ -2 & -1\end{array}\right]$ | $=[2+62+3]=[85]$ |
| :---: | :---: | :---: |
| [20 4] | $\left[\begin{array}{cc}1 & 1 \\ -2 & -1\end{array}\right]$ | $=\left[\begin{array}{ccc}20-8 & 20-4\end{array}\right]=\left[\begin{array}{ll}12 & 16\end{array}\right]$ |

So, the sequence of decoded row matrices is
[8 5], [12 16]
Now the $8^{\text {th }}$ English alphabet is $H$.
$5^{\text {th }}$ English alphabet is E.
$12^{\text {th }}$ English alphabet is L.
and the $16^{\text {th }}$. English alphabet is $P$.
Thus the receiver reads the message as "HELP"
32) By choosing the co-ordinate axes suitably, we take the equation of the straight line as
$y=m x+c \quad . .(1)$
and equation of parabola as $y^{2}=4 a x$
Substituting (1) in (2), we get
$(m x+c)^{2}=4 a x$
$\Rightarrow \mathrm{m}^{2} \mathrm{x}^{2}+\mathrm{c}^{2}+2 \mathrm{mcx}=4 \mathrm{ax}$
$\Rightarrow \mathrm{m}^{2} \mathrm{x}^{2}+\mathrm{x}(2 \mathrm{mc}-4 \mathrm{a})+\mathrm{c}^{2}=0$
Which is a quadratic equation in x .
This equation cannot have more than two solution. Hence, a straight line and a parabola cannot intersect at more than two points.
33) Given equation of the circle is
$3 x^{2}+(3-p) x y+q y^{2}-2 p x=8 p q$
For the circle, co-efficient of $x y=0$
$\Rightarrow 3-\mathrm{p}=0 \Rightarrow \mathrm{p}=3$
Also, co-efficient of $x^{2}=$ co-efficient of $y^{2}$
$\Rightarrow 3=\mathrm{q}$
$\therefore$ Equation of the circle is
$3 x^{2}+3 y^{2}-6 x=8(3)(3)$
$3 x^{2}+3 y^{2}-6 x-72=0$
Dividing by 3 , we get
$x^{2}+y^{2}-2 x-24=0$
Here $2 \mathrm{~g}=-2 \Rightarrow \mathrm{~g}=-1$
$1=0$ and $\mathrm{c}=-24$
Centre is $(-\mathrm{g},-\mathrm{f})(1,0)$
and $\mathrm{r}=\sqrt{g^{2}+f^{2}-c}$
$=\sqrt{(-1)^{2}+0+24}$
$=\sqrt{25}=5$ units.
34) By the mean value theorem we have, there exists 'c' $\in(2,7)$ such that,
$\frac{f(7)-f(2)}{7-2}=\mathrm{f}^{\prime}(\mathrm{c}) \leq 29$
Hence, $\mathrm{f}(7) \leq 5 \times 29+17=162$
Therefore, the maximum value of $f(7)$ is 162 .
35) Given slop at any point $=\frac{1}{4(\text { odinate })}$
$\Rightarrow \frac{d y}{d x}=\frac{1}{4 y}$
$\Rightarrow 4 y d y=d x$
integrating both sides we get,
$4 \int y \quad d y=\int d x$
$\Rightarrow \quad 4 \cdot \frac{y^{2}}{2}=x+c$
$\Rightarrow 2 y^{2}=x+c$...(1)
Since the curve passes through $(2,5)$,
we get $2(5)^{2}=2+\mathrm{c}$
$\Rightarrow 50-2=\mathrm{c}$
$\Rightarrow \mathrm{c}=48$.
$\therefore$ (1) becomes, $2 \mathrm{y}^{2}=\mathrm{x}+48$ which is the requaired equation of the curve.
36) $P(X=k)=\binom{n}{k} p^{k}(1-p)^{n-k}$
$E(X)=200 \times \frac{1}{600}+100 \times \frac{4}{600}+50 \times \frac{6}{600}-2 \times \frac{600}{600}$
$=\frac{200}{600}+\frac{400}{600}+\frac{300}{600}-2$
$=\frac{900}{600}-2=\frac{3}{2}-2=\frac{3-4}{2}$
$=\frac{-1}{2}=R s .-0.50$
37) We compute $|6-8 i|=\sqrt{6^{2}+(-8)^{2}}=10$
and applying the formula for square root, we get
$\sqrt{6-8 i}= \pm\left(\sqrt{\frac{10+6}{2}}-i \sqrt{\frac{10-6}{2}}\right)$
$= \pm(\sqrt{8}+i \sqrt{2})$
$= \pm(2 \sqrt{2}-i \sqrt{2})$
38) $\frac{x-1}{2}=\frac{y+1}{\lambda}=\frac{z}{2}$ and $\frac{x-1}{2}=\frac{y+1}{\lambda}=\frac{z}{\lambda}$
$\therefore \vec{a}=\hat{i}-\hat{j}, \vec{b}=2 \hat{i}+\lambda \hat{j}+2 \hat{k}$
$\vec{c}=-\hat{i}-\hat{j}, \vec{d}=5 \hat{i}+2 \hat{j}+\lambda \vec{k}$
$(\vec{c}-\vec{a})=-2 \hat{i}$,
and $(\vec{b} \times \vec{d})=\left|\begin{array}{ccc}\hat{i} & \hat{j} & \hat{k} \\ 2 & \lambda & 2 \\ 5 & 2 & \lambda\end{array}\right|$
$=\hat{i}\left(\lambda^{2}-4\right)-\hat{j}(2 \lambda-10)+\hat{k}(4-5 \lambda)$
Since the given lines are co-planar,
$(\vec{c}-\vec{a}) \cdot(\vec{b} \times \vec{d})=0$
$\Rightarrow(-2 \hat{i}) \cdot\left[\left(\lambda^{2}-4\right) \hat{i}-\hat{j}(2 \lambda-10)+\hat{k}(4-5 \lambda)\right]=0$
$\Rightarrow-2\left(\lambda^{2}-4\right)=0$
$\Rightarrow \lambda^{2}=4 \quad[\because-2 \neq 0]$
$\Rightarrow \lambda= \pm \sqrt{4}= \pm 2$
The Cartesian equation of the plane containing the given lines is
$\left|\begin{array}{ccc}x-x_{2} & y-y_{2} & z-z_{2} \\ b_{1} & b_{2} & b_{3} \\ d_{1} & d_{2} & d_{3}\end{array}\right|$
$\Rightarrow\left|\begin{array}{ccc}x+1 & y+1 & z \\ 2 & 2 & 2 \\ 5 & 2 & 2\end{array}\right|=0[\because \lambda=2]$
$\Rightarrow(x+1)(4-4)-(y+1)(4-10)+z(4-10)=0$
$\Rightarrow(x+1)(0)-(y+1)(-6)+z(-6)=0$
$\Rightarrow 6(y+1)-6 z=0$
$\Rightarrow y+1-z=0$
$\Rightarrow y-z+1=0$ which is the required equation of the plane containing the given lines
39) Let $\mathrm{I}=\int_{-\pi}^{\pi} \frac{\cos ^{2} x}{1+a^{x}} d x$

Using $\int_{a}^{b} \mathrm{f}(\mathrm{x}) \mathrm{dx}=\int_{a}^{b} \mathrm{f}(\mathrm{a}+\mathrm{b}-\mathrm{x}) \mathrm{dx}$ we get,
$\mathrm{I}=\int_{-\pi}^{\pi} \frac{\cos ^{2}(\pi-\pi-x)}{1+a^{\pi-\pi-x}} d x$
$=\int_{-\pi}^{\pi} \frac{\cos ^{2}(-x)}{1+a^{-x}} d x$
$=\int_{-\pi}^{\pi} a^{x}\left(\frac{\cos ^{2} x}{a^{x}+1}\right) d x \quad---(2)$
Adding (1) and (2) we get
$2 \mathrm{I}=\int_{-\pi}^{\pi} \frac{\cos ^{2} x}{a^{x}+1}\left(a^{x}+1\right) d x=\int_{-\pi}^{\pi} \cos ^{2} x d x$
$=2 x=\int_{-\pi}^{\pi} \cos ^{2} x d x$ (since $\cos ^{2} \mathrm{x}$ is an even function)
Hence, $\mathrm{I}=\int_{0}^{\pi}\left(\frac{1+\cos 2 x}{2}\right) d x=\frac{1}{2}\left[x+\frac{\sin 2 x}{2}\right]_{0}^{x}=\frac{1}{2}[\pi]=\frac{\pi}{2}$
40) Given $u(x, y, z)=x y^{2} z^{3}, x=\sin t, y=\cos t, z=1+e^{2 t}$
$\frac{\partial u}{\partial x}=y^{2} z^{3} ; \frac{\partial u}{\partial y}=2 x y z^{3}$
$\frac{\partial u}{\partial z}=3 x y^{2} z^{2}$
$\frac{\partial u}{\partial x}=\cos ^{2} t+\left(1+e^{2 t}\right)^{3} ;$
$\frac{\partial u}{\partial y}=2 \sin t \cos t\left(1+e^{2 t}\right)^{3} ;$
$\frac{\partial u}{\partial z}=3 \sin t \cos ^{2} t\left(1+e^{2 t}\right)^{3}$
$\frac{d x}{d t}=\cos t ; \frac{d y}{d t}=-\sin t$
$\frac{d z}{d t}=2 e^{2 t}$
By chain rule,
$\frac{d u}{d t}=\frac{\partial u}{\partial x} \cdot \frac{d x}{d t}+\frac{\partial u}{\partial y} \cdot \frac{d y}{d t}+\frac{\partial u}{\partial z} \cdot \frac{d z}{d t}$
$=\cos ^{2} t(1+e t)^{3}(\cos t)+2 \sin t \cos t\left(1+e^{2} t\right)^{3}(-\sin t)+3 \sin t \cos ^{2} t\left(1+e^{2} t\right)^{2}\left(2 e^{2} t\right)$
$=\left(1+e^{2} t\right) 2\left[\cos ^{3} t\left(1+e^{2} t\right)-2 \sin ^{2} t \cos t\left(1+e^{2 t}\right)+6 \sin \left(\cos ^{2} t e^{2 t}\right]\right.$
$\frac{d u}{d t}=\left(1+\mathrm{e}^{2 t}\right)^{2}\left[\cos ^{3} \mathrm{t}\left(1+\mathrm{e}^{2 \mathrm{t}}\right)-\sin \mathrm{t} \sin 2 \mathrm{t}\left(1 \mathrm{e}^{2 \mathrm{t}}\right)+6 \sin \mathrm{t} \cos ^{2} \mathrm{t} . \mathrm{e}^{2 \mathrm{t}}\right.$
$[\because \sin 2 \mathrm{t}=2 \sin \mathrm{t} \cos \mathrm{t}]$

## Answer All the Questions

41) a)

Giveny $=a x^{2}+b x+c$
$(-6,8)$ lies on $(1)$
$\Rightarrow 8=\mathrm{a}(-6)^{2}+\mathrm{b}(-6)+\mathrm{c}$
$\Rightarrow 8=36 z-6 b+c$
$(-2,12)$ lies on $(1)$
$\Rightarrow-12=\mathrm{a}(-2)^{2}+\mathrm{b}(-2)+\mathrm{c}$
$\Rightarrow-12=4 a-2 b+c$
Also $(3,8)$ lies on $(1)$
$\Rightarrow 8=\mathrm{a}(3)^{2}+\mathrm{b}(3)+\mathrm{c}$
$\Rightarrow 8=9 a+3 b+c$
Reducing the augment matrix to an equivalent row-echelon form by using elementary. row operations, we get,
$\left[\begin{array}{cccc}36 & -6 & 1 & 8 \\ 4 & -2 & 1 & -12 \\ 0 & 3 & 1 & 8\end{array}\right] \xrightarrow{\substack{R_{2} \rightarrow 9 R_{2}-R_{1} \\ R_{3} \rightarrow 4 R_{3}-R_{1}}}\left[\begin{array}{cclc}36 & -6 & 1 & 8 \\ 0 & -12 & 8 \mid & -116 \\ 0 & 18 & 3 & 24\end{array}\right]$
$\xrightarrow{\substack{R_{2} \rightarrow R_{2} \div 4 \\ R_{3} \rightarrow R_{3} \div 3}}\left[\begin{array}{cccc}36 & -6 & 1 & -8 \\ 0 & -3 & 2 & -29 \\ 0 & 0 & 5 & -8\end{array}\right]$
$\xrightarrow{R_{3} \rightarrow R_{3}+2 R_{2}}\left[\begin{array}{cccc}36 & -6 & 1 & -8 \\ 0 & -3 & 2 & -29 \\ 0 & 0 & 5 & -50\end{array}\right]$
Writing the equivalent equation from the row echelon matrix, we get $36 a-6 b+c=8$
$-3 b+2 c=-29$ .(2)
$5 \mathrm{c}=-50$
$\Rightarrow \mathrm{c}=\frac{-50}{5}=-10$
Substituting $\mathrm{c}=-10$ in (2) we get,
$-3 b+2(-10)=-29$
$\Rightarrow-3 \mathrm{~b}+2(-10)=-29$
$\Rightarrow-3 \mathrm{~b}-20=-29$
$\Rightarrow-3 \mathrm{~b}=-9$
$\Rightarrow \mathrm{b}=\frac{-9}{-3}=3$
Substituting $b=3$ and $c=-10$ in (1) we get,
$36 a-6(3)-10=8$
$\Rightarrow 36 \mathrm{a}-18-10=8$
$\Rightarrow 36 \mathrm{a}-28=8$
$\Rightarrow 6 \mathrm{a}=8+28=36$
$\Rightarrow \mathrm{a}=\frac{36}{36}=1$
$\therefore \mathrm{a}=1, \mathrm{~b}=3, \mathrm{c}=-10$
Hence the path of the boy is
$y=1\left(x^{2}\right)+3(x)-10$
$\Rightarrow \mathrm{y}=\mathrm{x}^{2}+3 \mathrm{x}-10$
Since his friend is at $\mathrm{P}(7,60)$,
$60=(7)^{2}+3(7)-10$
$\Rightarrow 60=49+21-10$
$\Rightarrow 60=70-10=60$
$\Rightarrow 60=60$
Since $(7,60)$ satisfies his path, he can meet his friend who is at $\mathrm{P}(7,60)$
b)

Given $\mathrm{z}=\mathrm{x}+\mathrm{iy}$
$\operatorname{Im}\left(\frac{2 z+1}{i z+1}\right)=0$
$\Rightarrow \operatorname{Im}\left(\frac{2(x+i y)+1}{i(x+i y)+1}\right)=0$
$\Rightarrow \operatorname{Im}\left(\frac{(2 x+1)+2 i y}{i x+i^{2} y+1}\right)$
$\Rightarrow \operatorname{Im}\left(\frac{(2 x+1)+2 i y}{i x-y+1}\right)$
$\left(\frac{(2 x+1)+i y}{(1-y)+i x}\right)$
Multiply and divide by the conjugate of the denominator
We get $\operatorname{Im}\left(\frac{(2 x+1)+2 i y}{(1-y)+i x} \times \frac{(1-y)-i x}{(1-y)-i x}\right)=0$
$\Rightarrow \operatorname{Im}\left(\frac{(2 x+1)+2 i y \times(1-y)-i x}{(1-y)^{2}+x^{2}}\right)$
Choosing the imaginably part we get,
$\underline{(2 x+1)(-x)+2 y(1-y)}$
$\Rightarrow(2 \mathrm{x}+1)-\mathrm{x}+2 \mathrm{y}(1-\mathrm{y})=0$
$\Rightarrow-2 x^{2}-x+2 y-2 y^{2}=0$
$\Rightarrow 2 \mathrm{x}^{2}+2 \mathrm{y}^{2}+\mathrm{x}-2 \mathrm{y}=0$
Hence, locus of $z$ is $2 x^{2}+2 y^{2}+x-2 y=0$
42) a)

We know that $\sin ^{-1}\left(\frac{x}{\sqrt{1+x^{2}}}\right)=\cos ^{-1}\left(\frac{x}{\sqrt{1+x^{2}}}\right)$
Thus, $\cos \left(\sin ^{-1}\left(\frac{x}{\sqrt{1+x^{2}}}\right)\right)=\frac{1}{\sqrt{1+x^{2}}}$
From the diagram, we have $\cot ^{-1}\left(\frac{3}{4}\right)=\sin ^{-1}\left(\frac{4}{5}\right)$
Hence, $\sin \left\{\cot ^{-1}\left(\frac{3}{4}\right)\right\}=\frac{4}{5}$
Using (1) and (2) in the given equation, we $\frac{1}{\sqrt{1+x^{2}}}=\frac{4}{5} \sqrt{1+x^{2}}=\frac{5}{4}$
Thus, $x= \pm \frac{3}{4}$
b)
$8 x^{\frac{3}{2 x}}-8 x^{\frac{-3}{2 x}=63}$
$\Rightarrow 8\left[\left(x^{\frac{1}{2 n}}\right)^{3}-\left(x^{\frac{-1}{2 n}}\right)^{3}\right]=63$
Put $x^{\frac{1}{2 n}}=y$
$\Rightarrow 8\left(y^{2}-\frac{1}{y^{3}}\right)=63$
$\Rightarrow y^{3}-\frac{1}{y^{3}}=\frac{63}{8} \Rightarrow \frac{y^{6}-1}{y^{3}}=\frac{63}{8}$
$\Rightarrow 8 y^{6}-8=63 y^{3}$
$\Rightarrow 8 y^{6}-63 y^{3}-8=0$
$\Rightarrow 8 t^{2}-63 t-8=0 \quad$ [where $\left.t=y^{3}\right]$
$\Rightarrow(8 t-1)(t-8)=0$
$\Rightarrow t=\frac{1}{8}, 8$
Case (i)when $t=8, \Rightarrow y^{3}=8 \Rightarrow y^{2}=2^{3}$
$\Rightarrow y=2$
Case (ii)when $t=\frac{1}{8}, y^{3}=\frac{1}{8} \Rightarrow y=\frac{1}{2}$
When $y=2, x^{\frac{1}{2 n}}=2$
$\Rightarrow x=(2)^{2 n} \quad \Rightarrow x=\left(2^{2}\right)^{n}$
$\Rightarrow x=4^{n}$
When $y=\frac{1}{2}, x^{\frac{1}{2 n}}=\frac{1}{2} \Rightarrow x=\left(\frac{1}{2}\right)^{2 n}$
$\Rightarrow x=\left(\frac{1}{2^{2}}\right)^{n}=\frac{1}{4^{n}}$
Hence the roots are $4^{n}$.
43) a)

Since the centre is located at $(0,300)$, midway between the two foci, which are the coast guard stations, the equation is $\frac{(y-300)^{2}}{a^{2}}-\frac{(x-0)^{2}}{b^{2}}=1$
To determine the values of $a$ and $b$, select two points known to be on the hyperbola and substitute each point in the above equation. The point $(0,400)$ lies on the hyperbola, since it is 200 km further from Station A than from station B.
$\frac{(400-300)^{2}}{a^{2}}-\frac{O}{b^{2}}=1 \frac{100^{2}}{a^{2}}=1, a^{2}=10000$. There is also a point $(\mathrm{x}, 600)$ on the hyperbola such that $6002+\mathrm{x}^{2}=(\mathrm{x}+200)^{2}$ $360000+x^{2}=x^{2}+400 x+40000$
$x=800$
Substituting in (1), we have $\frac{(600-300)^{2}}{10000}-\frac{(800-0)^{2}}{b^{2}}=1$
$9-\frac{640000}{b^{2}}=1$
$\mathrm{b}^{2}=80000$
Thus the required equation of the hyperbola is $\frac{(y-300)^{2}}{10000}-\frac{x^{2}}{80000}=1$
The ship lies somewhere on this hyperbola. The exact location can be determined using data from a third station.

b)

The Cartesian equations of the straight line $\vec{r}=(\hat{i}+\hat{3 j}-\hat{k})+t(2 \hat{i}+3 \hat{j}+2 \hat{k}) \quad$ is
$\frac{x-2}{1}=\frac{y-4}{2}=\frac{z+3}{4}=\mathrm{s}$ (say)
Then any point on this line is of the form $(2 s+1,3 s+3,2 s-1)$
The Cartesian equation of the second line is $\frac{x-2}{1}=\frac{y-4}{2}=\frac{z+3}{4}=t$ (say)
Then any point on this line is of the form $(t+2,2 t+4,4 t-3)$ $\qquad$
If the given lines intersect, then there must be a common point. Therefore, for some $s, t \in R$
we have $(2 \mathrm{~s}+1,3 \mathrm{~s}+3,2 \mathrm{~s}-1)=(\mathrm{t}+2,2 \mathrm{t}+4,4 \mathrm{t}-3)$
Equating the coordinates of $x, y$ and $z$ we get
$2 \mathrm{~s}-\mathrm{t}=1,3 \mathrm{~s}-2 \mathrm{t}=1$ and $\mathrm{s}-2 \mathrm{t}=-1$.
Solving the first two of the above three equations, we get $s=1$ and $t=1$. These values of $s$ and $t$ satisfy the third equation. So, the lines are intersecting.
Now, using the value of $s$ in (1) or the value of $t$ in (2), the point of intersection $(3,6,1)$ of these two straight lines is obtained. If we take $\vec{b}=(2 \hat{i}+3 \hat{j}+2 \hat{k})$ and $\vec{d}=\hat{i}+\hat{3 j}-\hat{k}$, then $\vec{b} \times \vec{d}=\left|\begin{array}{lll}\hat{i} & \hat{j} & \hat{k} \\ 2 & 3 & 2 \\ 1 & 2 & 4\end{array}\right|=8 \hat{i}-6 \hat{j}+\hat{k}$ is a vector perpendicular to
both the given straight lines. Therefore, the required straight line passing through $(3,6,1)$
and perpendicular to both the given straight lines is the same as the straight line passing through $(3,6,1)$ and parallel to
$8 \hat{i}-6 \hat{j}+\hat{k}$. Thus, the equation of the required straight line is
$\vec{r}=(\hat{3 i}+\hat{6 j}-\hat{k})+m(8 \hat{i}-6 \hat{j}+\hat{k}), \mathrm{k} \in \mathrm{R}$.
44) a)

The distance from the point $(1,1)$ to any point $(x, y)$ is $\mathrm{d}=\sqrt{(x-1)^{2}+(y-1)^{2}}$. Instead of extremising d , for convenience we extremise $\mathrm{D}=\mathrm{d}^{2}=(\mathrm{x}-1)^{2}+(\mathrm{y}-1)^{2}$ subject to the condition, $\mathrm{x}^{2}+\mathrm{y}^{2}=1$ Now, $\frac{d D}{d x}=2(\mathrm{x}-1)+2(\mathrm{y}-1) \times \frac{d y}{d x}$ where the $\frac{d y}{d x}$ will be computed by differentiating $\mathrm{x}^{2} \mathrm{y}^{2}+=1$ with respect to x . Therefore we get, $2 \mathrm{x}+2 \mathrm{y} \frac{d y}{d x}=0 \Rightarrow \frac{d y}{d x}=-\frac{x}{y}$ which gives us $\frac{d D}{d x}=2$ ( x
$-1)+2(y-1)\left(\frac{x}{y}\right)$
$=\frac{2[x y-y-x y+x]}{y}$
Substituting this, we get $\frac{d D}{d x}=2\left[\frac{x-y}{y}\right]=0$
$\Rightarrow \mathrm{x}=\mathrm{y}$
Since $(\mathrm{x}, \mathrm{y})$ lie on the circle $\mathrm{x}^{2}+\mathrm{y}^{2}+=1$ we get, $2 \mathrm{x}^{2}=1$ gives $\mathrm{x}= \pm \frac{1}{\sqrt{2}}$.
Hence the points at which the extremum distance occur are $\left(\frac{1}{\sqrt{2}}, \frac{1}{\sqrt{2}}\right),\left(-\frac{1}{\sqrt{2}},-\frac{1}{\sqrt{2}}\right)$
To find the extrema, we apply second derivative test. So,
$\frac{d^{2} D}{d x^{2}}=2 \frac{y^{2}+x^{2}}{y^{3}}$
The value of $\left(\frac{d^{2} D}{d x^{2}}\right)_{\left(\frac{1}{\sqrt{2}}, \frac{1}{\sqrt{2}}\right)}>0 ;\left(\frac{d^{2} D}{d x^{2}}\right)_{\left(-\frac{1}{\sqrt{2}},-\frac{1}{\sqrt{2}}\right)}<0$
This implies the nearest and farthest points are $\left(\frac{1}{\sqrt{2}}, \frac{1}{\sqrt{2}}\right)$ and $\left(-\frac{1}{\sqrt{2}},-\frac{1}{\sqrt{2}}\right)$
Therefore, the nearest and the farthest distances are respectively $\sqrt{2}-1$ and $\sqrt{2}+1$

b)

First we calculate $\frac{\partial w}{\partial x}(x, y)=\frac{\partial(x y)}{\partial x}+\frac{\partial\left(\frac{e^{y}}{y^{2}+1}\right)}{\partial x}$
This gives $\frac{\partial w}{\partial x}(\mathrm{x}, \mathrm{y})=\mathrm{y}+0$ and hence $\frac{\partial^{2} w}{\partial y \partial x}(\mathrm{x}, \mathrm{y})=1$ On the other hand,
$\frac{\partial w}{\partial y}(x, y)=\frac{\partial(x y)}{\partial y}+\frac{\partial\left(\frac{e^{y}}{y^{2}+1}\right)}{\partial y}$
$=x+\frac{\left(y^{2}+1\right) e^{y}-e^{y} 2 y}{\left(y^{2}+1\right)}$
Hence, $\frac{\partial^{2} w}{\partial x \partial y}(\mathrm{x}, \mathrm{y})=1$
45) a)

Equation of the given curves are $y^{2}=4 x$ and $x^{2}=4 y$

$\therefore$ Required area $=\int_{0}^{4}\left(\sqrt{4 x}-\frac{x^{2}}{4}\right) d x$
$=\int_{0}^{4}\left(2 \sqrt{x}-\frac{x^{2}}{4}\right) d x$
$=\left[\frac{2 x^{\frac{3}{2}}}{\frac{3}{2}}\right]_{0}^{4}\left[\frac{4}{3} x \sqrt{x}-\frac{x^{3}}{12}\right]_{0}^{4}$
$=\frac{4}{3}(4)(2)-\frac{64}{12}$
$=\frac{32}{3}-\frac{32}{6}=\frac{64-32}{6}=\frac{32}{6}$
$=\frac{16}{3}$ sq.units
Yes the area can be divided into 3 equal parts and the area to the divided among his, wife daughter and son is $=\frac{16}{3}$ sq.units
b)
$\left(x^{2}+y^{2}\right) d y=x y d x$
$\frac{d y}{d x}=\frac{x y}{x^{2}+y^{2}}$.
$\therefore p u t=v x \Rightarrow \frac{d y}{d x}=v+x \frac{d v}{d x}$
$\therefore$ (1) becomes,
$v+x \frac{d v}{d x}=\frac{x v x}{x^{2}+v^{2} x^{2}}$
$=\frac{x^{2} v}{x^{2}\left(1+v^{2}\right)}=\frac{v}{1+v^{2}}$
$x \frac{d v}{d x}=\frac{v}{1+v^{2}} v=\frac{v-v-v^{3}}{1+v^{2}}=\frac{-v^{3}}{1+v^{2}}$
Separating the variables we get,
$\frac{1+v^{2}}{v^{3}} d v=\frac{-d x}{x}$
$\Rightarrow \frac{1}{v^{3}}+\frac{v^{2}}{v^{3}} d v=\frac{-d x}{x}$
$\Rightarrow \int v^{-3} d v+\int \frac{d v}{v}=-\int \frac{d x}{x}$
$\Rightarrow \frac{v^{-2}}{-2}+\log \quad v=-\log x+\log c$
$\Rightarrow-\frac{1}{2 v^{2}}+\log \quad v=-\log \quad x+\log \quad c$
$\Rightarrow \frac{1}{2 v^{2}}-\log \quad v=\log x-\log c$
$\Rightarrow \frac{1}{2 v^{2}}=\log v+\log x-\log c$
$\Rightarrow \frac{1}{2 v^{2}}=\log v+\log x-\log c$
$\Rightarrow \frac{1}{2 v^{2}}=\log \left(\frac{v x}{c}\right)$
$\Rightarrow \frac{x^{2}}{2 y^{2}}=\log \left(\frac{y}{c}\right) \Rightarrow e^{\frac{x^{2}}{e^{2 y^{2}}}}=\frac{y}{c}$
$\Rightarrow y=c e^{\frac{x^{2}}{2 y^{2}}}$
Given $y(1)=1$
$1=c e^{\frac{1}{2}} \Rightarrow 1=c \sqrt{e}$
$\Rightarrow \quad c=\frac{1}{\sqrt{e}}$
$\therefore$ (2) becomes,
$y=\frac{1}{\sqrt{e}} e^{\frac{x^{2}}{2 y^{2}}}$
Also $y\left(x_{0}\right)=e \Rightarrow e=\frac{1}{\sqrt{e}} e^{\frac{x_{0}^{2}}{2 e^{2}}}$
$\Rightarrow e \sqrt{e}=e^{\frac{x_{0}^{2}}{2 e^{2}}}$
$\Rightarrow \frac{x_{0}^{2}}{2 e^{2}}=\log \quad e \sqrt{e}=\log e^{\frac{3}{2}}$
$\Rightarrow \frac{x_{0}^{2}}{2 e^{2}}=\frac{3}{2} \log _{e}^{e}=\frac{3}{2}(1)$
$\left[\because \log _{e}^{e}=1\right]$
$\Rightarrow x_{0}^{2}=\frac{3}{2}\left(2 e^{2}\right)=3 e^{2}$
$\Rightarrow x_{0}= \pm \sqrt{3 e^{2}}= \pm \sqrt{3} . e$
$\therefore x_{0}= \pm \sqrt{3}$. $e$
46) a)

Since the given function is a probability mass function, the total probability is one. That is $\Sigma_{x} f(x)=1$
From the given data $k+2 k+6 k+5 k+6 k+10 k+1$
$30 k=1 \Rightarrow k=\frac{1}{30}$
Therefore the probability mass function is

| x | 1 | 2 | 3 | 4 | 5 | 6 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $\mathrm{f}(\mathrm{x})$ | $\frac{1}{30}$ | $\frac{2}{30}$ | $\frac{6}{30}$ | $\frac{5}{30}$ | $\frac{6}{30}$ | $\frac{10}{30}$ |

(i) $\mathrm{P}(2<\mathrm{X}<6)=\mathrm{f}(3)+\mathrm{f}(4)+\mathrm{f}(5)=\frac{6}{30}+\frac{5}{30}+\frac{6}{30}=\frac{17}{30}$
(ii) $\mathrm{P}(2 \leq \mathrm{X} \leq 5)=\mathrm{f}(2)+\mathrm{f}(3)+\mathrm{f}(4)=\frac{2}{30}+\frac{6}{30}+\frac{5}{30}=\frac{13}{30}$
(iii) $\mathrm{P}(2 \leq 4)=\mathrm{f}(1)+\mathrm{f}(2)+\mathrm{f}(3)+\mathrm{f}(4)=\frac{1}{30}+\frac{2}{30}+\frac{6}{30}+\frac{5}{30}=\frac{14}{30}$
(iv) $\mathrm{P}(3>\mathrm{X})=\mathrm{f}(4)+\mathrm{f}(5)+\mathrm{f}(6)=\frac{5}{30}+\frac{6}{30}+\frac{10}{30}=\frac{21}{30}$
b) a)

Given $a * b=\frac{a+b}{2} \forall \in Q$
i) Closure property:

Let $a, b \in Q$
$\therefore \mathrm{a} * \mathrm{~b}=\frac{a+b}{2} \in \mathrm{Q}$
[ $\because$ addition and division are closed on Q ]

* is closed on Q .
(ii) Commutative property:

Let $\mathrm{a}, \mathrm{b} \in \mathrm{Q}$
Then $\mathrm{a}+\mathrm{b}=\frac{a+b}{2}=\frac{b+a}{2}=b * a$
$\therefore \mathrm{a} * \mathrm{~b}=\mathrm{b} * \mathrm{a} \forall \mathrm{a}, \mathrm{b} \in \mathrm{Q}$
$\therefore *$ is commutative on Q .
Associative property
Let $\mathrm{a}, \mathrm{b}, \mathrm{c} \in \mathrm{Q}$
$\mathrm{a}^{*}(\mathrm{~b} * \mathrm{c})=\left(\mathrm{a}^{*} \mathrm{~b}\right) * \mathrm{c}$
Let $a=2, b=3, c-5$
$\therefore \mathrm{a}^{*}\left(\mathrm{~b}^{*} \mathrm{c}\right)=2^{*}(3 *-5)$
$=*\left(\frac{3-5}{2}\right)$
$=2 *(-1)=\frac{2+(-1)}{2}$
$=\frac{1}{2}$
Now (a*b)*c=(2*3)*(-5)
$=\left(\frac{2+3}{2}\right) *(-5)$
$=\frac{5}{2} *-5=\frac{\frac{5}{2}+(-5)}{2}$
$=\frac{5-10}{4}=\frac{-5}{4} \ldots(2)$
From (1)\&(2), $\mathrm{a}^{*}(\mathrm{~b} * \mathrm{c}) \neq\left(\mathrm{a}^{*} \mathrm{~b}\right) * \mathrm{c}$
$\therefore$ * is not associative on Q .
b)

Given $a * b=\frac{a+b}{2}$, where $\mathrm{a} . \mathrm{b} \in \mathrm{Q}$ Let $\mathrm{a}, \mathrm{b} \in \mathrm{Q}$
An element e has to found out such that
$a^{*}=e^{*}$ a $=a$
Let $\mathrm{a}=5$, Then $5^{*} \mathrm{e}=5$
$\Rightarrow \frac{5+e}{2}=5 \Rightarrow 5+\mathrm{e}=10$
Let $\mathrm{a}=\frac{2}{3}$. Then $\frac{2}{3} * \mathrm{e}=\frac{2}{3}$
$\Rightarrow \frac{\frac{2}{3}+e}{2}=\frac{2}{3}$
$\Rightarrow \frac{2}{3}+e=\frac{4}{3}$
$\Rightarrow e=\frac{4}{3}-\frac{2}{3}=\frac{2}{3}$
Since identity differs for every element, the identity does not exist for Q .
$\therefore$ * has no identity on Q .
$\therefore$ * has no inverse on Q .
Hence, identity and inverse does not exist for Q under the given binary operation *.
47) a)

Consider a triangle $A B C$ in which the two altitudes $A D$ and $B E$ intersect at $O$. Let $C O$ be produced to meet $A B$ at $F$. We take $O$ as the origin and let $\overrightarrow{O A}=\vec{a}, \overrightarrow{O B}=\vec{b}$ and $\overrightarrow{O C}=\vec{c}$

Since $\overrightarrow{A D}$ is perpendicular to $\overrightarrow{B C}$, we have $\overrightarrow{O A}$ is perpendicular to $\overrightarrow{B C}$, and hence we get $\overrightarrow{O A} \cdot \overrightarrow{B C}=0$. Thnat is,
$\vec{a} \cdot(\vec{c}-\vec{b})=0$, which means
$\vec{a} . \hat{c}-\hat{a} . \hat{b}=0$
Similarly, since $\overrightarrow{B E}$ is perpendicular to $\overrightarrow{C A}$, we have $\overrightarrow{O B}$ is perpendicular to $\overrightarrow{C A}$, and hence we get $\overrightarrow{O B} \cdot \overrightarrow{C A}=0$. That is,
$\vec{a} \cdot \hat{c}-\hat{b} \cdot \hat{c}=0$ $\qquad$
Adding equations (1) and (2), gives $\vec{a} \cdot \hat{c}-\hat{b} \cdot \hat{c}=0$. That is, $\hat{c}(\hat{a}-\hat{b})=0$
That is $\overrightarrow{O C} \cdot \overrightarrow{B A}=0$. Therefore, $\overrightarrow{B A}$ is perpendicular to $\overrightarrow{O C}$. Which implies that $\overrightarrow{C F}$ is perpendicular to $\overrightarrow{A B}$. Hence, the perpendicular drawn from C to the side AB passes through O . Therefore, the altitudes are concurrent

Fig. 7.36
Factorising the given function, we have
$y=f(x)=(x-3)\left(x^{2}+3 x+3\right)$.
(1) The domain and the range of the given function $f(x)$ are the entire real line.
(2) Putting $y=0$, we get the $x=3$. The other two roots are imaginary. Therefore, the $x$-intercept is $(3,0)$. Putting $x=0$, we get $y=$
-9 . Therefore, the $y$-intercept is $(0,-9)$
(3) $f^{\prime}(x)=3\left(x^{2}-2\right)$ and hence the critical points of the curve occur at $x= \pm \sqrt{2}$
(4) $f^{\prime \prime}(x)=6 x$. Therefore at $x=\sqrt{2}$ the curve has a local minimum because $f^{\prime \prime}(\sqrt{2})=6 \sqrt{2}>0$. Then local minimum is $f(\sqrt{2})=-4$
$\sqrt{2}-9$. Similarly $x=-\sqrt{2}$ the curve has a local maximum because $f^{\prime \prime}(-\sqrt{2})=-6 \sqrt{2}<0$. The local maximum is $f(-\sqrt{2})=4 \sqrt{2}-9$.
(5) Since $f^{\prime \prime}(x)=6 x>0, \forall x>0$ the function is concave upward in the positive real line. As $f "(x)=6 x<0, \forall x<0$ the function is concave downward in the negative real line.
(6) Since $\mathrm{f}^{\prime \prime}(\mathrm{x})=0$ at $\mathrm{x}=0$ and $\mathrm{f}^{\prime \prime}(\mathrm{x})$ changes its sign when passing through $\mathrm{x}=0$. Therefore the point of inflection is $(0, \mathrm{f}(0))=$ $(0,9)$.
(7) The curve has no asymptotes.

The rough sketch of the curve is shown on the right side.
