## Metre Bridge II

## Aim:

To compare the resistances of the given two resistors.

## Apparatus:

Metre Bridge, Cells, Key, Resistance Box, Carbon Resistances, Galvanometer, Jockey, Breadboard etc.

Theory:
According to the Wheatstone's principal, when bridge is balanced at a balancing length $\boldsymbol{I}$ $\frac{R_{1}}{R_{2}}=\frac{l r}{(100-l) r}=\frac{l}{(100-l)}$ where $\mathbf{r}$ is the resistance per unit length of the wire AB.

## Observations:

1. To find the ratio of resistances

| Resistance <br> $\mathbf{R}_{\mathbf{1}}$ is in | Balancing length (l) cm | $(100-\mathrm{l})$ <br> cm | $\frac{R_{1}}{R_{2}}=\frac{l}{(100-l)}$ <br> Left gap |
| :---: | :---: | :---: | :---: |
|  |  |  |  |
| Right gap |  |  |  |

$$
\text { Mean } \frac{R_{1}}{R_{2}}=
$$

## RESULTS:

1. The Ratio of Resistances of given resistors
