## Algebraic form of a number sequence is the algebraic expression of the relationship between the term and its position .

## More activty .

(1) Write the algebraic expression for each of the sequences below:
i) Sequence of odd numbers
ii) Sequence of natural numbers which leave remainder 1 on division by 3 .
iii) The sequence of natural numbers ending in 1 .
iv) The sequence of natural numbers ending in 1 or 6 .
(2) For the sequence of regular polygons starting with an equilateral triangle, write the algebraic expressions for the sequence of the sums of inner angles, the sums of the outer angles, the measures of an inner angle, and the measures of an outer angle.
(3) Look at these pictures:

The first picture is got by removing the small triangle formed by joining the midpoints of an equilateral triangle. The second picture is got by removing such a middle triangle from each of the red triangles of the first picture. The third picture shows the same thing done on the second.
i) How many red triangles are there in each picture?
ii) Taking the area of the original uncut triangle as 1 , compute the area of a small triangle in each picture.
iii) What is the total area of all the red triangles in each picture?
iv) Write the algebraic expressions for these three sequences
